8-HYDROXY-7-SUBSTITUTED QUINOLINES AS ANTI-VIRAL AGENTS

FIELD OF THE INVENTION

The present invention provides for 8-hydroxy-7-substituted quinoline
5 compounds and pharmaceutically acceptable salts thereof which are useful as
antiviral agents. The invention also relates to a pharmaceutical composition
containing such compound in combination with a suitable excipient, the composition
being useful in combating viral infections. The invention also relates to a method
for selectively combating viral infections in animals, including man. Specifically,
10 these compounds have anti-viral activity against the herpes virus, cytomegalovirus
(CMV). Many of these compounds are also active against other herpes viruses, such
as the varicella zoster virus, the Epstein-Barr virus, the herpes simplex virus, and
the human herpes virus type 8 (HHV-8).

BACKGROUND OF THE INVENTION

15 The herpesviruses comprise a large family of double stranded DNA viruses.
The herpesvirus family can be divided into three subfamilies (α , β , γ) based upon a
number of biological properties such as host range and tropism, viral life cycle, and
viral persistence and latency. Eight of the herpesviruses, herpes simplex virus types
1 and 2 (HSV-1 and HSV-2), varicella zoster virus (VZV), human cytomegalovirus
20 (HCMV), Epstein-Barr virus (EBV), and human herpes viruses 6, 7, and 8 (HHV-6,
HHV-7, and HHV-8), have been shown to infect humans.

HSV-1 and HSV-2 are the prototypic α -herpesviruses. These two serotypes
share approximately 50% nucleotide homology. Both are neurotropic viruses, but
their primary sites of replication are different. HSV-1 typically infects the oral
25 mucosa resulting in ulcerations commonly referred to as cold sores. HSV-2 infects
and causes ulcerations of the genital mucosa. HSV infection can also result in
disseminated disease and encephalitis, especially in immunocompromised patients.
D.O. White and F.J. Fenner, In Medical Virology, D.O. White and F.J. Fenner, eds.,
Academic Press, p. 318-347 (1994).

30 VZV is also an α -herpesvirus and is the causative agent of chicken pox. VZV
establishes a latent infection in the dorsal root ganglia of the peripheral nervous
system. From its latent site, VZV can cause recurrent disease commonly referred to
as shingles or zoster. The probability of shingles increases with age and frequently
occurs in immunocompromised patients. A.M. Arvin, In Virology, B.N. Field, D.M.
35 Knipe, and P.M. Howley, ed., Lippincott-Raven Press, New York, p. 2547-2586
(1996).

- Human cytomegalovirus (HCMV), a β -herpesvirus, is an ubiquitous agent producing infection in individuals of all age groups. Infection rates of 60-100%, depending on geographic area and socioeconomic status have been reported. R.J. Whitley, S. Goldsmith and J. Gnann, In Society for General Microbiology. 45th Symposium: Control of Virus Diseases, Mimmock, N.J.; P.D. Griffiths and C.R. Madely, eds., Cambridge University Press, Cambridge, p. 315 (1990). The majority of infections are asymptomatic. However infections occurring in the immunocompromised patient, including organ transplant recipients and individuals with AIDS may be severe and include HCMV induced pneumonia, colitis, and retinitis.
- 10 L.W. Drew, Clin. Infect. Dis. 14:608-615 (1992). HCMV is the leading cause of blindness in AIDS patients. T.C. Merigan and S. Resta, Rev. Infect. Dis. 12:S693 (1990). HCMV also establishes lifelong latency in the host.

- HCMV DNA polymerase (HCMV pol) is an enzyme essential for viral replication. D.H. Spector, K.M. Klucher, D.K. Rabert and D.A. Wright, In Herpesvirus Transcription and Its Regulation, E.K. Wagner, ed., CRC Press, Boca Raton, FL, p. 261 (1991). The current therapies for HCMV; Ganciclovir, Foscarnet and Vistide act by inhibition of HCMV pol. A.K. Field and K.K. Biron, Clin. Micro. Reviews 7:(1) 1-13 (1994). See also US Patents 4,199,574; 4,215,113; 4,355,032; and E. DeClercq et al., Antiviral Research, Vol 8, pages 261-272 (1987). Ganciclovir and Foscarnet display significant toxicity and induction therapy is restricted to an intravenous route of administration. D. Faulds and R.C. Heel, Drugs, 39:597 (1990). Maintenance therapy with Ganciclovir and Foscarnet will likely contribute to drug resistant virus. A.K. Field and K.K. Biron, Clin. Micro. Reviews 7:(1) 1-13 (1994). Clearly less toxic, orally bioavailable alternatives are needed.

- 25 EBV is a γ -herpesvirus which replicates in the epithelial cells of the nasopharynx and salivary glands and resides latently in B-cells. Childhood infections of EBV are normally asymptomatic. However, EBV infection is associated with several diseases in adults such as infectious mononucleosis, Burkitt's lymphoma, nasopharyngeal carcinoma, and Hodgkins disease. A.B. Rickinson and E. Kieff, In Virology, B.N. Fields, D.M. Knipe, and P.M. Howley, eds., Lippincott-Raven Press, New York, p. 2397-2446 (1996).

- HHV-6 is a β -herpesvirus which causes roseola (exanthem subitum) in children. P. Lusso, Antivir. Res. 31:1-21 (1996). HHV-7 shares 50-60% nucleotide sequence homology with HHV-6. It's disease association is unclear, but it may be involved in some cases of roseola. N. Frenkel and E. Roffman, In Virology, B.N. Fields, D.M. Knipe, P.M. Howley, eds., Lippincott-Raven Press, New York, p. 2609-

2622 (1996). HHV-8, also known as Kaposi's sarcoma associated herpesvirus (KSHV), is a γ -herp virus which has recently been associated with Kaposi's sarcoma in AIDS patients and multiple myeloma. M.B. Rettig et al., Science, 276:1851-1854 (1997).

INFORMATION DISCLOSURE

Published Japanese patent application H1-136152 published 29 May 1989 discloses a silver halide photographic light-sensitive material comprising a support, and thereon, at least 1 silver halide emulsion layer containing a cyan dye-forming coupler represented by a broad generic formula. This broad generic formula
10 includes 8-hydroxy-quinoline derivatives substituted by a wide variety of substituents, e.g., substituted carboxamide groups at the 7-position. None of the specific compounds disclosed in this reference are structurally similar to the compounds of the present invention. Also, the compounds of the present invention are useful as pharmaceutical agents, specifically HCMV inhibitors, whereas the
15 reference compounds are useful in color photography.

Published Japanese patent application HEI 3-73949 published 28 March 1991 discloses a thermally developable color light-sensitive material comprising at least a light-sensitive silver halide, a reducing agent, a binder, and a coupler represented by a first generic formula and/or a second generic formula on a support. These broad
20 generic formulas include 8-hydroxy-quinoline derivatives substituted by a wide variety of substituents, e.g., substituted carboxamide groups at the 7-position. As noted for the previous Japanese reference, none of the specific compounds disclosed in this reference are structurally similar to the compounds of the present invention. Also, the compounds of the present invention are useful as pharmaceutical agents,
25 specifically HCMV inhibitors, whereas the reference compounds are useful in color photography.

Published Japanese patent application 02152966 A2 discloses 4-hydroxy-carbostyryl derivatives as anti-allergy and antiinflammatory agents. The compounds of the present invention are 1-(N-unsubstituted)- 8-hydroxy-7-quinoline-carboxamides.
30

US Patent No. 4,959,363 discloses 1-(N-substituted)-1,4-dihydro-4-oxo-6-and/or-7-substituted-3-quinolinecarboxamides as antiviral agents. The compounds of the present invention are 1-(N-unsubstituted)-8-hydroxy-7-quinolinecarboxamides.

US Patent Nos. 5,459,146 and 5,506,236 disclose 4-substituted-3-alkyl-pyrazolo[3,4-b]quinoline compounds as antiviral agents. Basically, these compounds
35 are the tricyclic version of compounds such as those disclosed in the '363 patent

above, and are structurally very different from the compounds of the present invention.

US Patent No. 5,378,694 discloses compounds such as 1-(N-substituted)-3-substituted-4-hydroxy-2-quinolinones, and generically, 3-substituted-4-hydroxycoumarin compounds as antiviral agents. US Patent No. 5,412,104 discloses compounds similar to those disclosed in the '694 patent for anti-viral or anti-hypertensive use; however, these 1-(N-substituted) reference compounds are disclosed as having substituents other than hydroxy at the 4-position of the quinolinone ring. The compounds of the present invention are 1-(N-unsubstituted)-8-hydroxy-7-quinolinecarboxamides.

German patent DE 1 908 548 discloses a variety of compounds including 4-hydroxy-quinoline compounds which may be substituted at the 3-position by carboxamide groups, and which are useful against cold viruses.

Published German patent application DE 44 25 647 A1 discloses heterocyclic-1-phenyl substituted quinolone and naphthyridone carboxylic acids for treating retroviral infections; Published German patent application DE 44 25 648 A1 discloses 6 and 6,8-substituted 1-[4-(1H-1,2,4-triazol-1-yl-methyl)phenyl] quinolone carboxylic acids for treating retroviral infections; Published German patent application DE 44 25 650 A1 discloses substituted triazolylmethylphenyl-naphthyridone carboxylic acids for treating retroviral infections; Published German patent application DE 44 25 659 A1 discloses N1-diverse 6-fluoro-8-difluoromethoxy substituted quinolone carboxylic acids for treating retroviral infections. The compounds of these references are structurally very different from the compounds of the present invention.

Derwent Abstract 96-246942/25 of JP 8099957-A discloses optionally heterocyclyl substituted 4-oxo-quinoline and naphthyridine derivatives which are useful for treating herpes, particularly herpes simplex virus, herpes zoster virus and cytomegalovirus.

Derwent Abstract 95-271358/36 of JP 7165748-A discloses compounds having heterocyclic ketones which are used in antiviral agents for treating cytomegalovirus infectious disease.

Nowhere do these references teach or suggest the specific 8-hydroxyquinoline-7-carboxamide compounds of the present invention which are useful as anti-HCMV agents.

US Patent 5,463,072 discloses a process for the preparation of naphtholic 2-equivalent cyan couplers which are useful in color photography. It discloses an 8-

hydroxy-quinoline compound having a substituted triazole moiety at the 6-position and a carbamoyl moiety at the 7-position.

International Publication WO 95/11592, published 4 May 1995, discloses a marine structure carrying a coating comprising a layer which contains a quinoline
5 compound, or an N-oxide or a salt thereof, having antifouling activity. It generically discloses such compounds with a variety of substituents, such as hydroxy, (optionally substituted C₁₋₁₂-alkyl)sulphonyl, (optionally substituted aryl)sulphonyl, mono or di (optionally substituted C₁₋₁₂alkyl)aminosulphonyl.

Derwent Abstract 91-232424/32 (Sandoz AG) discloses the use of 5HT-3
10 antagonists for the prevention or reduction of dependence on alcohol, psycho-stimulants, nicotine or opiates. A variety of compounds is disclosed including quinoline compounds having unsubstituted phenyl rings.

Derwent Abstract 90-343755/46 (Sandoz Ltd.) discloses serotonin 5-HT3
antagonists used for treating stress-related psychiatric disorders, rhinitis, nasal
15 disorders and lung embolism. It discloses a variety of compounds, including quinoline compounds substituted by bridged piperidine groups.

Derwent Abstract 90-290145/38 (DuPont DeNemours Co.) discloses n-substituted naphthalene or quinoline sulphonamides which are radio and chemosensitising agents in tumour treatment. Other than the sulfonamide bonds, the
20 quinoline compounds are not further substituted on their phenyl rings.

Derwent Abstract 90-264471/35 (Yoshitomi Pharm. Ind. KK.) discloses (iso)quinoline-sulphonamide compounds and their acid addition salts as vasodilators and cerebral circulation improving agents.

Derwent Abstract 85-063337/11 (Sandoz-Patent-GmbH) discloses a variety of
25 new fused heterocyclic sulphonic amide and ester derivatives with analgesic, antiarrhythmic and antipsychotic activities.

Derwent Abstract 22,706 (Pfizer & Co.) discloses quinoline derivatives and their acid addition salts as bronchodilators, but no sulfonamide substituents are disclosed for these compounds.

30 U.S. Patent 5,240,940 discloses fungicidal compositions comprising a combination of two fungicides, one of which is a quinoline or cinnoline compound. U.S. Patent 4,881,969 discloses sulfonamides as herbicidal agents.

European Published applications 0326330 and 0326328 discloses quinoline, quinazoline and cinnoline fungicides.

35 JP 63307451 discloses a silver halide color photographic photosensitive material with improved granularity containing a water-soluble coupler capable of a

coupling reaction with an oxidant main ingredient in color developing, which coupler may include specific 8-hydroxy-quinoline compounds.

JPO7033729-A discloses the production of N-cyano-N-substituted-arylcarboxyimidamide compounds in which aryl may be 8-quinolyl groups.

- 5 International Publication Number WO 96/25399, published 22 August 1996, discloses aroylaniline derivatives which exhibit anti-retroviral activity.

International Publication Number WO 97/03069, published 30 January 1997, discloses substituted heteroaromatic compounds which are protein tyrosine kinase inhibitors, in particular to substituted quinolines and quinazolines.

- 10 International Publication Number WO 96/06084, published 29 February 1996, discloses quinolylamine derivatives which are useful for the treatment of arrhythmia.

- European Patent Application No. 0206751, published 30 December 1996, discloses 2-substituted-phenylalkenyl-quinoline derivatives which are useful as
15 selective antagonists of leukotrienes of D₄.

International Application No. WO 9632015 discloses synergistic fungicidal compositions made of quinoline derivatives and cytochrome complex III inhibitors.

European Patent Application No. 0399818 discloses diarylstyrylquinoline diacids which are leukotriene antagonists and inhibitors of leukotriene biosynthesis.

- 20 These compounds are useful as anti-asthmatic, anti-allergic, anti-inflammatory and cytoprotective agents.

SUMMARY OF THE INVENTION

The present invention particularly provides:

A compound of formula IA

- 25 wherein R⁰ is

h) $-C_3-C_8$ cycloalkyl,
i) $-(CH_2)_n$ -aryl substituted by R^6 ,
10 j) $-(CH_2)_n$ -het substituted by R^7 , or
k) $-CH_2-C_3-C_8$ cycloalkyl;

wherein R^6 is

- a) -H,
b) -F,
15 c) -Cl, or
d) -Br;

wherein R^7 is

- a) -H,
b) -F,
20 c) -Cl, or
d) -Br;

wherein R^8 is

- a) $-C_1-C_4$ alkyl,
b) $-W^1-H$, or
25 c) $-CH_2W^1H$;

wherein R^9 is

- a) $-C_1-C_7$ alkyl,
b) $-C_3-C_8$ cycloalkyl,
c) $-C(O)R^{11}$,
30 d) $-C(O)NHR^{11}$,
e) $-CH(OH)R^{11}$,
f) $-CH_2OH$,
g) $-CO_2R^{11}$, or
h) -aryl;

35 wherein R^{10} is

- a) -H,

- b) $-C_1-C_6$ alkyl,
- c) $-C_3-C_8$ cycloalkyl,
- d) $-(CH_2)_n$ -aryl optionally substituted with F, Cl, CH_2OH or $-NO_2$,
- e) $-(CH_2)_n$ -het, or
- 5 f) $-CH_2-C_3-C_3$ cycloalkyl;

wherein R^{11} is

- a) $-C_1-C_7$ alkyl,
- b) $-C_3-C_8$ cycloalkyl,
- c) $-(CH_2)_n X^1$, or
- 10 d) $-CH_2-C_3-C_8$ cycloalkyl;

wherein X^1 is

- a) -aryl substituted by zero (0), one (1), two (2), or three (3) R^4 ,
- b) -het substituted by zero (0), one (1) or two (2) R^5 ,
- c) $-C_1-C_8$ alkyl,
- 15 d) $-CH(OH)$ -phenyl,
- e) $-S$ -phenyl,
- f) $-NHSO_2$ -phenyl substituted by one (1), two (2) or three (3) R^4 ,
- g) $-CN$,
- h) $-OH$,
- 20 i) $-C_3-C_8$ cycloalkyl substituted by zero (0), one (1) or two (2) R^8 , or
- j) -4 -cyano-2,3,5,6-tetrafluoro-phenyl;

wherein X^2 is

- a) -aryl substituted by zero (0), one (1), two (2) or three (3) R^4 ,
- b) -het substituted by zero (0), one (1) or two (2) R^5 ,
- 25 c) $-C_1-C_8$ alkyl,
- d) $-CH(OH)$ -phenyl, or
- e) $-C_3-C_8$ cycloalkyl substituted by zero (0), one (1) or two (2) R^8 ;

wherein W^1 is

- a) $-NH$,
- 30 b) -oxygen, or
- c) -sulfur;

wherein V^1 is

- a) $-R^{11}$,
- b) $-C(O)R^{11}$,
- 35 c) $-SO_2R^{11}$, or
- d) $-C(O)NHR^{11}$;

wherein Z^1 is

- a) $-C_1-C_7$ alkyl,
- b) $-C_3-C_8$ cycloalkyl,
- c) $-C(O)R^{11}$,
- 5 d) $-C(O)NHR^{11}$, or
- e) $-CO_2R^{11}$;

wherein -aryl is

- a) -phenyl,
- b) -naphthyl,
- 10 c) -biphenyl,
- d) -tetrahydro-naphthyl, or
- e) fluorenyl;

wherein -het is a 5-, 6- or 7-membered saturated or unsaturated ring containing from one (1) to three (3) heteroatoms selected from the group consisting of nitrogen, oxygen and sulfur; and including any bicyclic group in which any of the above heterocyclic rings is fused to a benzene ring or another heterocyclic;

wherein -cycloalkyl is a saturated or unsaturated hydrocarbon ring including any bicyclic group in which the above ring is connected to a benzene, heterocyclic or other hydrocarbon ring;

20 wherein n is zero (0) to six (6), inclusive;

wherein p is one (1), two (2) or three (3);

or a pharmaceutically acceptable salt or N-oxide thereof.

The present invention further provides:

The compound of formula IA provided that:

- 25 a) when R^0 is $-(CH_2)_n-X^1$ and X^1 is -OH, then n is one or greater; and
- b) when R^0 is $-(CH_2)_p-W^1X^2$, W^1 is -oxygen or -sulfur and X^2 is phenyl then R^4 is other than t-pentyl.

The present invention also provides:

A compound of formula I

30 wherein R^1 is

- a) -H,
- b) -F,
- c) -Cl,
- d) -Br,
- 35 e) $-CF_3$, or
- f) $-NO_2$;

wherein R² is

- a) -H,
- b) -C₁-C₃alkyl,
- c) -OH,
- 5 d) -CF₃,
- e) -CH=CH-furanyl,
- f) -CH=CH-phenyl substituted by zero (0) or one (1) R⁴,
- g) -CH=CH-pyridinyl, or
- h) -(CH₂)_p-phenyl substituted by zero (0) or one (1) R⁴;

30 wherein X^2 is

- a) -O-,
- b) -S-, or
- c) -NH-;

wherein n is zero (0) to four (4) inclusive;

35 wherein aryl is

- a) phenyl substituted by zero (0) to two (2) R^5 , or

b) naphthyl substituted by zero (0) to two (2) R^6 ;

wherein het is a 5-, 6- or 7-membered saturated or unsaturated ring containing from one (1) to three (3) heteroatoms selected from the group consisting of nitrogen, oxygen and sulfur; and including any bicyclic group in which any of the above

5 heterocyclic rings is fused to a benzene ring or another heterocycle; and the ring may be connected through a carbon or secondary nitrogen in the ring or an exocyclic nitrogen; and if chemically feasible, the nitrogen and sulfur atoms may be in the oxidized forms; and if chemically feasible, the nitrogen atom may be in the protected form;

10 wherein R^6 is

a) -H,

b) $-C_1-C_5$ alkyl,

c) -F,

d) -Cl,

15 e) $-OCH_3$,

f) $-CF_3$,

g) $-NHSO_2$ -het substituted by zero (0) to two (2) $-C_1-C_6$ alkyl, or

h) $-NHSO_2$ -phenyl;

or a pharmaceutically acceptable salt thereof;

20 A compound of formula III

wherein R^1 is

a) -H,

b) $-CH_3$, or

c) $-CH=CH$ -phenyl;

25 wherein R^2 is

a) $-(CH_2)_n R^3$,

b) $-(CH_2)_n -X^2-R^3$, or

c) $-CH(R^4)R^3$;

wherein R^3 is

30 a) -phenyl substituted by zero (0) to two (2) R^6 ,

b) -het,

c) -naphthyl, or

d) $-C_{3-6}$ cycloalkyl;

wherein R^4 is

35 a) $-CH_3$, or

b) -phenyl;

wherein R⁶ is

- a) -F,
- b) -Cl,
- c) -NHSO₂-phenyl;

5 wherein X¹ is

- a) -Cl, or
- b) -Br;

wherein X² is

- a) -O-, or
- 10 b) -S-;

wherein het is

- a) -imidazolyl, or
- b) -indolyl.

The present invention also provides:

15 A compound of the formula IV

where X¹ is

- a) -H,
- b) -F,
- c) -Cl,
- 20 d) -Br, or
- e) -I;

wherein R₂, R₃ and R₄ may be the same or different and are

- a) -C₁-C₅ alkyl, or
- b) -phenyl.

25 Also provided is:

A compound of formula V

wherein X¹ is

- a) phenyl substituted by zero (0) to three (3) R⁴,
- b) naphthyl substituted by zero (0) to three (3) R⁴,
- 30 c) fluorenyl substituted by zero (0) to three (3) R⁴,
- d) het substituted by zero (0) to one (1) R⁵, or
- e) 4-cyano-2,3,5,6-tetrafluorophenyl;

wherein R⁴ is

- a) -F,
- 35 b) -Cl,
- c) -Br,

- d) -I,
e) -NO₂,
f) -CN,
g) -CF₃,
5 h) -C₁-C₆ alkyl,
i) phenyl,
j) cyclohexyl,
k) hydroxymethyl,
l) -OR¹⁰,
10 m) -SR¹⁰, or
n) -SO₂NH-het;

wherein het is

- a) 1,3-benzodioxol-4-yl,
b) 1,3-benzodioxo-5-yl,
15 c) coumarinyl,
d) indazoyl,
e) indolyl,
f) benzothiazolyl,
g) benzothiadiazolyl,
20 h) quinolinyl,
i) pyridinyl,
j) 1,3,4-thiadiazol-2-yl, or
k) isoxazolyl substituted with one or two C₁-C₄ alkyl;

wherein R⁶ is

- 25 a) -F,
b) -Cl,
c) -Br,
d) -I,
e) -CF₃,
30 f) -C₁-C₄-alkyl, or
g) -C₁-C₂-alkylsubstituted with an aryl;

wherein R¹⁰ is

- a) hydrogen,
b) -C₁-C₄ alkyl,
35 c) phenyl,
d) benzyl, or

e) 4-nitrophenyl; as well as

A compound of formula V

wherein het is

- a) indazolyl,
- 5 b) indoyl, or
- c) isoxazolyl substituted with one (1) or two (2) C₁-C₄ alkyl.

Finally, the present invention provides:

A compound of formula VI or VII

wherein X is

- 10 a) -C, or
- b) -SO;

wherein Y is

- a) -NH,
- b) -O, or
- 15 c) -S;

wherein EWG is an electron withdrawing group;

wherein R¹, R² and R³ are as defined in claim 1;

wherein R⁴ is

- a) -H,
- 20 b) -(CH₂)_n-CO₂-C₁-C₆ alkyl,
- c) -(CH₂)_m-phenyl optionally substituted with one (1) or two (2) R⁷,
- d) -(CH₂)_m-het,
- e) -C₁-C₆ alkyl optionally substituted by one R⁶,
- f) -C₁-C₄ alkyl-NH-COOCH₂-benzyl, or
- 25 g) -C₁-C₄ alkyl-S-CH₃;

wherein R⁶ is pyrrolidin-1-yl optionally substituted with EWG or R⁶;

wherein n is zero (0) to three (3);

wherein m is zero (0) to one (1);

- wherein -het is a 5-, 6- or 7-membered saturated or unsaturated ring containing
- 30 from one (1) to three (3) heteroatoms selected from the group consisting of nitrogen, oxygen and sulfur; and including any bicyclic group in which any of the above heterocyclic rings is fused to a benzene ring or another heterocyclic;

wherein R⁶ is

- a) hydroxy,
- 35 b) -C₁-C₆ alkyloxy,
- c) mercapto, or

d) $-C_1-C_6$ alkylmercapto;

wherein R^7 is

a) hydroxy, or

b) $-C_1-C_6$ alkyloxy; as well as

5 A compound of formula VI or VII

wherein R^7 is t-butyl;

wherein EWG is

a) $-NH-CO_2C(CH_3)_3$,

b) $-CN$,

10 c) $-COX^2-C_1-C_6$ alkyl, or

d) $-COOH$;

wherein X^2 is

a) $-O-$, or

b) $-NH$; and

15 wherein het is

a) 1,3-benzodioxol-4-yl,

b) 1,3-benzodioxol-5-yl, or

c) indolyl.

"Pharmaceutically acceptable salts" refers to those salts which possess the
20 biological effectiveness and properties of the parent compound and which are not
biologically or otherwise undesirable.

"N-oxide" refers to the oxidized form of the nitrogen in the ring of the 8-
hydroxy-quinoline compounds of the present invention. The preparation of such
compounds is well known to one of ordinary skill in organic chemistry, including
25 methods such as oxidation with metachloro-peroxy-benzoic acid.

"Electron-withdrawing group" means any substituent on the ring which tends
to draw electron density from the ring. Examples of such groups include halogen,
nitro, cyano, carboxylic acids, carboxylic esters, sulfoxides, sulfones, sulfonamides,
ketones and aldehydes.

30 "Halogen" means fluoroine, chlorine, or bromine.

"Het" is a 5-, 6- or 7-membered saturated or unsaturated ring containing from
one (1) to three (3) heteroatoms selected from the group consisting of nitrogen,
oxygen and sulfur; and including any bicyclic group in which any of the above
heterocyclic rings is fused to a benzene ring or another heterocycle; and the ring
35 may be connected through a carbon or secondary nitrogen in the ring or an exocyclic
nitrogen; and if chemically feasible, the nitrogen and sulfur atoms may be in the

oxidized forms; and if chemically feasible, the nitrogen atom may be in the protected form; and substituted or unsubstituted. Examples of "het" include the following: thiadiazolyl, thiazolyl, benzothiazolyl, pyridinyl (or pyridyl), morpholinyl, imidazolyl, indolyl, and piperazinyl.

5 The compounds of the present invention are named according to the IUPAC or CAS nomenclature system.

 The carbon atom content of various hydrocarbon-containing moieties is indicated by a prefix designating the minimum and maximum number of carbon atoms in the moiety, i.e., the prefix C_i-C_j indicates a moiety of the integer "i" to the integer "j" carbon atoms, inclusive. Thus, for example, (C₁-C₃)alkyl refers to alkyl of 10 one to three carbon atoms, inclusive, or methyl, ethyl, propyl and isopropyl, straight and branched forms thereof.

 Throughout this application, abbreviations which are well known to one of ordinary skill in the art may be used, such as "Ph" for phenyl, "Me" for methyl, and 15 "Et" for ethyl.

 The following Charts A-I describe the preparation of the compounds of the present invention. All of the starting materials are prepared by procedures described in these charts or by procedures analogous thereto, which would be well known to one of ordinary skill in organic chemistry. All of the final compounds of 20 the present invention are prepared by procedures described in these charts or by procedures analogous thereto, which would be well known to one of ordinary skill in organic chemistry. All of the variables used in the charts are as defined below or as in the claims.

CHART A

25 The preparation of the starting materials, 8-hydroxyquinoline-7-carboxylic acids, is accomplished in low to moderate yields by the carboxylation of 8-hydroxyquinolines, which are either commercially available or which are prepared by literature methods: G.S. Bajwa, K.E. Hartman, and M.N. Jouillie, Journal of Medicinal Chemistry, Vol.16, No. 2, pages 134-138 (1973); L.C. March, W.A. 30 Romanchick, G.S. Bajwa, and M.M. Jouillie, Journal of Medicinal Chemistry, Vol. 16, No. 4, pages 337-342 (1973). The compound of formula A-1 is reacted with K₂CO₃ (3 eq.), CO₂(800 p.s.i) at 170° for 7 days, to yield the compound of formula A-2. J. Hannah et al., Journal of Medicinal Chemistry, Vol. 21, No. 11, pages 1093-1100 (1978). (R¹ and R² in formula A-1 are the same as R¹ and R² in formula A-2.) 35 The compound of formula A-2 wherein R¹ is -H and R² is -H is the intermediate compound of Preparation 1 below. The compound of formula A-2 wherein R¹ is -F

and R² is -H is the intermediate compound of Preparation 4 below. The compound of formula A-2 wherein R¹ is -Cl and R² is -H is the intermediate compound of Preparation 3 below. The compound of formula A-2 wherein R¹ is -H and R² is -CH₃ is the intermediate compound of Preparation 5 below.

5

10

CHART B

Bromination of 8-hydroxyquinoline-7-carboxylic acid of formula B-1 with one equivalent of bromine (HOAc, reflux, 1 hr) yields 5-bromo-8-hydroxy-7-quinoline-carboxylic acid of formula B-2 in quantitative yield, which is prepared in

15 Preparation 2 below. R. Schmitt and F. Engelmann, Chem. Ber., 20; 1887; 2694.

20

CHART C

The acid of formula C-1, prepared as described in Charts A and B above, is condensed with the amine of formula C-2, which is commercially available (e.g, *p*-chloro or *p*-nitrobenzylamine), under appropriate conditions (EDC is used as the coupling agent, HOBT, DMF, rt, 18 hr) to yield the compound of formula C-3. (R¹ and R² in formula C-1 are the same as R¹ and R² in formula C-3. X in formula C-2 is the same as X in formula C-3.) The compound of formula C-3 wherein R¹ is -Br, R² is -H and X is -Cl is the final compound of Example 9 below. The compound of formula C-3 wherein R¹ is -H, R² is -CH₃ and X is -Cl is the final compound of Example 10 below. The compound of formula C-3 wherein R¹ is -Cl, R² is -H and X is -Cl is the final compound of Example 11 below. The compound of formula C-3 wherein R¹ is -H, R² is -H and X is -NO₂ is the final compound of Example 12 below. The compound of formula C-3 wherein R¹ is -F, R² is -H and X is -Cl is the final compound of Example 16 below. Chart C is the preferred coupling method for benzylamines.

35

CHART D

Under the same conditions as in Chart C above (i.e., EDC, HOBT, DMF, rt, 7 days), the acid of formula D-1 is condensed with the heterocyclic amine of formula D-2 to give the final compound of formula D-3, which is prepared in Example 8 below.

CHART E

Chart E discloses a more efficient method of coupling the 8-hydroxyquinoline-7-carboxylic acids with anilines and heterocyclic amines utilizing PCl_3 as the condensing agent. H. Singh, A.K. Singh, S. Sharma, R.N. Iyer, *J. Med. Chem.*, 20:826 (1977); H. Singh, S. Sharma, R.N. Iyer, *Ind. J. Chem.*, 15B:73 (1977); S.K. Dubey, A.K. Singh, H. Singh, S. Sharma, R.N. Iyer, *J. Med. Chem.*, 37:999 (1994). The compound of formula E-1 is coupled with the compound of formula E-2 (using PCl_3 , xylenes, at reflux, for 18hr) to yield the compound of formula E-3 wherein X is -H (which is the final compound of Example 5 below) or X is -Br (which is the final compound of Example 6 below). (X in formula E-1 is the same as X in formula E-3.) Chart E is the preferred coupling method for heterocyclic amines.

5

CHART F

The required thiazolones of formula F-3 are prepared in three steps from commercially available acids of formula F-1 as follows: the compound of formula F-1 is first treated with $P_{(red)}$ in Br and is then treated with AcCl in methanol to yield the compound of formula F-2. This compound is then reacted with thiourea at ethanol at reflux to yield the compound of formula F-3. T. Sohda et al., Chem. Pharm. Bull., Vol. 30, No. 10, pages 3601-3616 (1982).

15

CHART G

Anilines are also coupled in low to moderate yields under the conditions of Chart E. Thus, the compound of formula G-1 is coupled with the compound of formula G-2 (using PCl_3 , xylenes, at reflux, for 18 hours) to yield the compound of formula G-3. (R^1 in formula G-1 is the same as R^1 in formula G-3.) The compound of formula G-3 wherein R^1 is -H is the final compound of Example 3 below; the compound of formula G-3 wherein R^1 is -Br is the final compound of Example 4 below; and the compound of formula G-3 wherein R^1 is -Cl is the final compound of Example 15 below. The coupling conditions of this reaction are preferred when anilines are used.

30

CHART H

Chart H discloses another method of coupling which is used in the condensation of benzylamines, although the yields are lower than found for the EDC couplings. The compound of formula H-1 is coupled with the compound of formula

H-2 (using PCl_3 , xylenes, at reflux for 18 hr) to yield the compound of formula H-3, which is the final compound of Example 1 below.

CHART I

- 10 Other heterocyclic amines are also condensed with quinoline carboxylic acids under these conditions. The quinoline carboxylic acid of formula I-1 (which was prepared in Chart A above) is coupled with the appropriate heterocyclic amine of formula I-2, I-4, I-6 or I-8 (using PCl_3 , xylenes, at reflux, for 18 hours) to yield the compound of formula I-3, I-5, I-7 or I-9, respectively. The compound of formula I-3
- 15 is the final compound of Example 2 below; the compound of formula I-5 is the final compound of Example 7 below; the compound of formula I-7 is the compound of Example 13 below which is useful as an intermediate; and the compound of formula I-9 is the final compound of Example 14 below.

CHART J

The preparation of the starting materials is accomplished by O-methylation of

20 commercially-available 5,7-dihalo-8-hydroxyquinolines according to the procedure of R.A.W. Johnstone and M.E. Rose in Tetrahedron, vol. 35, page 21169 (1979). The compound of formula J-1 is treated with *t*-butyllithium or *n*-butyllithium at low temperature in ether/toluene, then exposed to sulfur dioxide gas to prepare the compound of formula J-2. Conversion of the compound of formula J-2 to the sulfonyl

25 chloride of formula J-3 is accomplished by treatment with *N*-chlorosuccinimide (CH_2Cl_2 , 3 hr). The sulfonamide of formula J-4 is then prepared by reaction of the sulfonyl chloride of formula J-3 with 1 equivalent of a primary amine of the formula R^2NH_2 and 2 equivalents of pyridine in CH_2Cl_2 (15 hr). Finally, the compound of formula J-5 is prepared using either excess pyridinium hydrochloride (220 °C, 10

30 min) or excess boron tribromide (CH_2Cl_2 , 1.5 hr).

CHART K

Compounds of the structure K-3 are prepared from commercially-available 5,7-dihalo-8-hydroxyquinolines (K-1) in two steps. Formation of the silylether

15 intermediates K-2 is accomplished by reaction of the 8-hydroxyquinolines K-1 with chlorotrialkylsilanes in the presence of imidazole and DMF at room temperature for 18-20 hours. The intermediates are then treated with *t*-butyllithium or *n*-butyllithium at low temperature in THF to give the compound of formula K-3.

CHART L

To a mixture of *o*-anidisine of L-1 and ethyl-4,4,4-trifluoroacetoacetate of L-2 is added 6N HCl. The resulting enamine is heated in diphenylether at 250°C to produce 4-hydroxy-8-methoxy-2-trifluoromethylquinoline of L-3.

30

CHART M

The compound of M-1 is chlorinated with phosphorus oxychloride in $\text{CH}_2\text{Cl}_2/\text{DMF}$ at room temperature. The resulting chloride of M-2 is reductively cleaved by hydrogenation in EtOH, Et_3N to give M-3. Methyl ether deprotection with pyridine hydrochloride at 220°C gives 2-trifluoromethyl-8-hydroxyquinoline of M-4. This material is carboxylated to M-5 under Kolbe-Schmidt conditions. Standard amide couplings gives the desired products of M-6.

CHART N

Alternatively, pyridine hydrochloride deprotection of N-1 gives the 4,8-dihydroxyquinoline of N-2, which again is carboxylated under Kolbe-Schmidt conditions to give N-3. Standard amide couplings give the desired products of N-4.

20

25

CHART O

Aryl aldehydes of O-2 are condensed with 8-hydroxyquinaldine of O-1 at 180°C to form the 2-styryl-8-hydroxyquinolines of O-3. These are carboxylated under Kolbe-Schmidt conditions to give O-4. Standard couplings of the resulting acid with amines gives the desired amides O-5.

30

CHART P

The preparation of the starting material of formula P-1 is accomplished by
 10 chlorination of commercially-available 8-hydroxyquinoline according to the
 procedure described in DE 1770065. The compound of formula P-1 is then treated
 with neat fluorsulfonic acid at 120 °C to form the compound of formula P-2.
 Finally, the sulfonamides of formula P-3 are prepared by heating to 140 °C a
 mixture of 1 eq of the sulfonyl fluoride of formula P-2, 2 eq of the primary amine of
 15 formula RNH₂ and 3 eq of N,N-diisopropylethylamine in chlorobenzene.

CHART Q

The preparation of the starting material of formula Q-1 is accomplished by O-
 methylation of commercially-available 5,7-dibromo-2-methyl-8-quinolinol according
 25 to the procedure of R. A. W. Johnstone and M. E. Rose in Tetrahedron, vol. 35, page
 21169 (1979). The styrene derivative of formula Q-2 is obtained by heating the 2-
 methylquinoline of formula Q-1 with benzaldehyde for 18 h. The intermediate of
 formula Q-2 (which corresponds to J-1, R¹ = CH=CHPh, X¹ = X² = Br) is then
 advanced in four steps to the sulfonamides of formula Q-3 (which corresponds to J-5,
 30 R¹ = CH=CHPh, X¹ = Cl; R² = R) following the route previously described in Chart J.

CHART R

The preparation of the starting material of formula R-1 is accomplished by chlorination of commercially-available 8-hydroxyquinoline according to the procedure described in DE 1770065. The 7-iodo derivative of formula R-2 is then prepared by reaction of the quinoline of formula R-1 with iodine monochloride in methanol. The compound of formula R-2 is treated successively with methyl magnesium bromide and n-butyllithium at -78 °C in THF, then exposed to sulfur dioxide gas to prepare the compound of formula R-3. Conversion of the compound of formula R-3 to the sulfonyl chloride of formula R-4 is accomplished by treatment with N-chlorosuccinimide in methylene chloride at room temperature for 2 h. The sulfonamide of formula R-5 is then prepared by reaction of the sulfonyl chloride of formula R-4 with 2-(4-aminophenyl)ethylamine and pyridine in methylene chloride. Finally, the compound of formula R-6 is prepared by reaction of the compound of formula R-5 with excess sulfonyl chloride of the formula RSO_2Cl in pyridine.

CHART S

The commercially-available 5-fluoro-8-hydroxyquinoline of formula S-1 is treated with neat chlorosulfonic acid at 90-105 °C to form the sulfonyl chloride of formula S-

2. The sulfonamide of formula S-3 is then prepared by reaction of 1 eq of the sulfonyl chloride of formula S-2 with 3 eq of benzylamine in THF.

CHART T

10 Commercially available 8-hydroxyquinoline (T-1) is converted to the 7-carboxylic acid (T-2) by heating at 175° C in the presence of potassium carbonate under 800 psi carbon dioxide gas for 7 days. The acid is then condensed with various aliphatic amines after activation with either 1,1'-carbonyldiimidazole, or alternatively 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide and 1-hydroxybenzotriazole to afford the

15 desired amides of the formula T-3. The above amides are prepared either as discrete analogues or as part of a parallel synthesis block.

CHART U

Anhydride U-1 is prepared from 8-hydroxy-7-quinoline carboxylic acid using 2,2,2-trichloroethyl chloroformate and diisopropylethylamine. The purity of the starting

35 materials is crucial for this reaction to succeed; particularly, any trace of any metallic cations but alkali cations, or Lewis acids, has to be avoided, as they lead to an

inhibition of the reaction as well as to decarboxylation of anhydride U-1, probably through a chelation of both starting material and product; during the whole course of the reaction, strictly basic conditions have to be maintained, acidic conditions favoring a decarboxylation of the product as well. Ester U-3 is prepared from 8-hydroxy-7-quinoline carboxylic acid as well, the 8-hydroxy substituent being first protected to ester U-2 according to a literature procedure (German Patent No. 540842, 10 December 1931) and subsequent activation of the 7-carboxylic acid as its fluoride, using cyanuric fluoride and diisopropylethylamine.

10

15

CHART V

N-Aryl-8-hydroxy-7-quinolinecarboxamides V-4-14 are prepared as single compounds from anhydride U-1 (Chart U) following GP II described below. Both amide coupling and deprotection of the 8-hydroxy substituent can be realized in a single step with primary amines, provided some traces of water are present in the reaction mixture. (No water needs to be added; water coming from glassware and used solvents is enough to ensure a complete deprotection, at least on small scale.) Probably, the amide function of the still protected intermediate is nucleophilic enough to attack the carbonate at the 7-position via a six-membered ring; subsequent hydrolysis, catalyzed by pyridinium chloride, leads to the desired amides. Similarly, N-Aryl-8-hydroxy-7-quinolinecarboxamides V-21-36 are prepared by parallel synthesis from anhydride U-1, following GP III described below. N-Aryl-8-hydroxy-7-quinolinecarboxamides V-15-20 are prepared as single compounds following GP IV described below from ester U-3 (Chart U). After the coupling step is achieved (6 h to 5 days depending on the amine), methanol is added, which leads to the deprotection of the 8-hydroxy substituent within 6 to 24 h. N-aryl-8-hydroxyquinoline-7-carboxamides V-17-20 as well as V-37-94 are also prepared by parallel synthesis from ester U-3, following GP V described below.

When parallel synthesis is used, some impurities appear occasionally besides

the desired product, mainly the carbamate resulting from an attack of the amine at the carbonate positions when anhydride U-1 is involved, or methyl 8-hydroxy-7-quinoline carboxylate after methanolic treatment of the reaction mixture from ester U-3.

CHART W

The synthesis of 2-amino-5-alkyl-1,3,4-thiadiazoles W-95-98, W-100-102, W-105, W-108 and X-109-117, which are to be coupled with the activated 8-hydroxy-7-quinoline carboxylic acid derivatives U-1 or U-3 (refer to Chart U) to afford the corresponding 8-hydroxy-N-(1,3,4-thiadiazol-2-yl)-7-quinolinecarboxamides X-118-136, required one to four steps. 2-Amino-5-bromo-1,3,4-thiadiazole W-95 is prepared through bromination of commercially available 2-amino-1,3,4-thiadiazole. Thiadiazole derivatives W-96-98 are prepared through direct bromide displacement of thiadiazole W-95 with the corresponding amines. Using the same strategy, nitrile W-100 is prepared from aminonitrile W-99, itself prepared from piperonal through a Strecker synthesis. Displacement of the bromide of thiadiazole W-95 with L- and D-phenylalanine methyl esters leads to esters W-101 and W-102, though in low yields. Known literature procedures are used to prepare amino acids W-103 and W-106, of which acid groups are converted into the corresponding tert-butyl esters (compounds W-104 and W-107) by standard procedures; subsequent bromide displacement as last step affords esters W-105 and W-108.

30

CHART X

Bromide displacement with commercially available piperonyl amine leads to thiadiazol W-109; similarly, using some amino acid tert-butyl esters leads to esters X-110 to X-117.

These thiadiazoles, as well as commercially available 2-amino-5-(trifluoromethyl)-1,3,4-thiadiazole, are then coupled using the same methodology as described for the amides V-4-20 from anhydride U-1 or ester U-3 to give amides Y-118-125 or y-126-136, respectively. Depending on the applied work-up procedure, these compounds are isolated as the free compounds, as the hydrochloride salt or as a hydrate.

CHART AA

- 25 N-(5-alkylamino-1,3,4-thiadiazol-2-yl)-8-hydroxy-7-quinolinesulfonamides are prepared from the corresponding thiadiazoles and 8-hydroxy-7-quinolinesulfonyl chloride AA-C, prepared in two steps from a 8-hydroxy-7-halogenoquinoline AA-A.

It will be apparent to those skilled in the art that the described synthetic procedures are merely representative in nature and that alternative synthetic processes are known to one of ordinary skill in organic chemistry.

15 The compounds of the present invention and pharmaceutically acceptable salts thereof are useful as antiviral agents. Thus, these compounds are useful to combat viral infections in animals, including man. Specifically, these compounds have anti-viral activity against the herpes virus, cytomegalovirus (CMV). Many of these compounds are also active against other herpes viruses, such as the varicella
20 zoster virus, the Epstein-Barr virus, the herpes simplex virus, and the human herpes virus type 8 (HHV-8).

Also, while many of the compounds of the present invention have shown activity against the CMV polymerase, these compounds may be active against the cytomegalovirus by this or other mechanisms of action. Thus, the description below
25 of these compounds' activity against the CMV polymerase is not meant to limit the present invention to a specific mechanism of action.

The compounds of the present invention have shown activity in one or more of the assays described below. All of these assays are indicative of a compound's activity and thus of its use as an anti-viral agent.

30 The HCMV polymerase assay is performed using a scintillation proximity assay (SPA) as described in several references, such as N.D. Cook, et al., Pharmaceutical Manufacturing International, pages 49-53 (1992); K. Takeuchi, Laboratory Practice, September issue (1992); US Patent No. 4,568,649 (1986); which are incorporated by reference herein. Reactions are performed in 96-well plates.
35 The assay is conducted in 100 μ l volume with 5.4 mM HEPES (pH 7.5), 11.7 mM KCl, 4.5 mM $MgCl_2$, 0.36 mg/ml BSA, and 90 nM 3H -dTTP. Assays are run with and

without CHAPS, (3-[(3-Cholamidopropyl)-dimethylammonio]-1-propane-sulfonate) at a final concentration of 2 mM. HCMV is diluted in enzyme dilution buffer containing 50% glycerol, 250 mM NaCl, 10 mM HEPES (pH 7.5), 100 µg/ml BSA, and 0.01% sodium azide. The HCMV polymerase, which is expressed in recombinant baculovirus-infected SF-9 cells and purified according to literature procedures, is added at 10% (or 10 µl) of the final reaction volume, i.e., 100 µl. Compounds are diluted in 50% DMSO and 10 µl are added to each well. Control wells contain an equivalent concentration of DMSO. Unless noted otherwise, reactions are initiated via the addition of 6 nM biotinylated poly(dA)-oligo(dT) template/primer to reaction mixtures containing the enzyme, substrate, and compounds of interest. Plates are incubated in a 25°C or 37°C H₂O bath and terminated via the addition of 40 µl/reaction of 0.5 M EDTA (pH 8) per well. Reactions are terminated within the time-frame during which substrate incorporation is linear and varied depending upon the enzyme and conditions used, i.e., 30 min. for HCMV polymerase. Ten µl of streptavidin-SPA beads (20 mg/ml in PBS/10% glycerol) are added following termination of the reaction. Plates are incubated 10 min. at 37°C, then equilibrated to room temperature, and counted on a Packard Topcount. Linear regressions are performed and IC₅₀'s are calculated using computer software. Results of the testing of compounds of the present invention in this assay are shown in Tables 1, 2, 5, 9, 10, 11, 13 (except for the last compound which was tested under modified conditions) and 14 below.

A modified version of the above HCMV polymerase assay is performed as described above, but with the following changes: Compounds are diluted in 100% DMSO until final dilution into assay buffer. In the previous assay, compounds are diluted in 50% DMSO. 4.5 mM dithiothreitol (DTT) is added to the polymerase buffer. Also, a different lot of CMV polymerase is used, which appears to be more active resulting in a more rapid polymerase reaction. Results of the testing of compounds of the present invention in this assay are shown in Tables 3, 6 and 7 below.

Compounds are tested for direct antiviral activity against HCMV using a cell culture based assay. An ELISA (enzyme linked immunosorbant assay) format is used as described in W.A. Tatarowicz, N.S. Lurain and K.D. Thompson, J. Virol. Meth., 35:207-215 (1991). Human foreskin fibroblast cells are infected with HCMV at a multiplicity of 0.025 plaque forming units per microtiter plate well for a period of 90 minutes. The virus inocula is removed and a suspension of test compound prepared in tissue culture media is added for a period of 4 days. The growth media

is aspirated and replaced with 95% ethanol to allow fixation of virus infected cultures. The ethanol is removed and the wells are washed twice with saline. A solution of 2% dry fat milk, 1% bovine sera albumin prepared in saline is added to wells to allow for non-specific binding of protein material to plastic surfaces for 1
5 hr. Murine monoclonal antibody prepared in saline directed against the late (65KD) matrix protein of HCMV is added to test wells for 1 hr. The wells are washed twice and antibody, conjugated with the enzyme horse radish peroxidase, with specificity against murine IgG is added to test wells for 1 hr. Test wells are washed three times with saline. A solution of o-phenylene diamine, a substrate for horse radish
10 peroxidase is added for 15 minutes at which time enzymatic conversion occurs indicating reactivity of the enzyme with its substrate. This conversion is evident as a color reaction which was spectrophoretically monitored at 490 nm. The intensity of the color indirectly reflects the presence of antibody directed against the viral 65 KD matrix antigen. The presence of the viral matrix antigen reflects the amount of
15 HCMV replication. Thus, test wells, in which little viral replication has occurred, would have little or no antibody binding and are present with low levels of color. Non-infected wells serve as the assay background control. Results of the testing of compounds of the present invention in this assay are shown in Tables 4, 7 and 12 below.

20 These compounds of the present invention are administered in a pharmaceutical composition containing the compound in combination with a suitable excipient, the composition being useful in combating viral infections. Pharmaceutical compositions containing a compound appropriate for antiviral use are prepared by methods and contain excipients which are well known in the art. A generally
25 recognized compendium of such methods and ingredients is Remington's Pharmaceutical Sciences by E.W. Martin (Mark Publ. Co., 15th Ed., 1975), which is hereby incorporated by reference herein.

The compounds of the present invention are administered parenterally (for example, by intravenous, intraperitoneal or intramuscular injection), topically,
30 orally, or rectally, depending on whether the preparation is used to treat internal or external viral infections.

For internal infections, the compositions are administered orally or parenterally at dose levels, calculated as the free base, of about 0.1 to 300 mg/kg, preferably 1.0 to 30 mg/kg of mammal body weight, and are used in man in a unit
35 dosage form, administered one to four times daily in the amount of 1 to 1000 mg per unit dose.

For parenteral administration or for administration as drops, as for eye infections, the compounds are presented in aqueous solution in a concentration of from about 0.1 to 10%, more preferably about 0.1 to 7%. The solution may contain other ingredients, such as emulsifiers, antioxidants or buffers.

5 The exact regimen for administration of the compounds and compositions disclosed herein will necessarily be dependent upon the needs of the individual subject being treated, the type of treatment and, of course, the judgment of the attending practitioner.

5-Chloro-8-hydroxy-2-methyl-N-[2-[4-[(phenylsulfonyl)amino]phenyl]ethyl]-7-quinolinesulfonamide.

DESCRIPTION OF PREFERRED EMBODIMENTS

PREPARATION 1 8-Hydroxyquinoline-7-carboxylic acid (Formula A-2 wherein R¹ is -H and R² is -H) Refer to Chart A.

5

8-Hydroxyquinoline (50.0 g) and potassium carbonate (142.8 g) are mixed together in a stainless steel bomb and heated at 170 °C under 1200 p.s.i. CO₂ for 7 days. The reaction is then cooled and the resulting solid is partitioned between water (6 L) and EtOAc (1 L). The organic layer is extracted with water (2X 300 mL). The combined aqueous layers are extracted with EtOAc (3X 500 mL). The aqueous layer is then acidified to pH 4.5 with conc. HCl. The resulting solid is collected, dried and triturated with i-PrOH to yield 51.97 g of the title compound as a tan solid.

Physical characteristics are as follows:

¹H NMR (300 MHz, DMSO) δ 8.89, 8.58, 7.89, 7.78, 7.28.

EXAMPLE 1 N-[(4-Chlorophenyl)methyl]-8-hydroxy-7-quinolinecarboxamide (Formula H-3) Refer to Chart H.

25

A solution of 8-hydroxyquinoline-7-carboxylic acid (0.250 g) of Preparation 1 and 4-chlorobenzylamine (0.187 g) in 25 mL xylenes is heated to reflux. To this is added dropwise PCl₃ (0.073 g). Refluxing is continued overnight. The reaction is then cooled and water is added to destroy excess PCl₃. The resulting solid is collected and recrystallized from EtOAc/hexanes to yield 0.088 g of the title product as a yellow solid.

Physical characteristics are as follows:

MP 162-165 °C.

¹H NMR (300 MHz, DMSO) δ 9.46, 8.93, 8.43, 8.03, 7.70, 7.46, 7.39, 4.56.

- 5 **EXAMPLE 2** N-[5-[(4-Chlorophenyl)methyl]-1,3,4-thiadiazol-2-yl]-8-hydroxy-7-quinolinecarboxamide (Formula I-3) Refer to Chart I.

10

A solution of 8-hydroxyquinoline-7-carboxylic acid (0.236 g) of Preparation 1 and 2-amino-5-(4-chlorobenzyl)thiadiazole (0.282 g) in 25 mL xylenes is heated to reflux. To this is added dropwise PCl_3 (0.069 g). Refluxing is continued overnight.

- 15 The reaction is then cooled and water is added to destroy excess PCl_3 . The resulting solid is collected, dried and recrystallized HOAc to yield 0.079 g of the title product as a gold solid.

Physical characteristics are as follows:

MP 276-278 $^{\circ}\text{C}$.

- 20 ^1H NMR (300 MHz, DMSO) δ 8.87, 8.75, 8.04, 7.88, 7.39, 7.17, 4.37.

(Formula G-3 wherein R¹ is -Br) Refer to Chart G.

15

A solution of 5-bromo-8-hydroxyquinoline-7-carboxylic acid (2.68 g) of
20 Preparation 2 and 4-chloroaniline (1.28 g) in 250 mL xylenes is heated to reflux. To
this is added dropwise PCl₃ (0.69 g). Refluxing is continued overnight. The reaction
is then cooled and water is added to destroy excess PCl₃. The resulting solid is
collected, washed with water and dried. The crude product is recrystallized from
EtOAc/hexanes to yield 1.97 g of the title product as an orange solid.

EXAMPLE 7 N-[5-(5-Bromo-2-thienyl)-2-thiazolyl]-8-hydroxy-7-quinolinecarboxamide (Formula I-5) Refer to Chart I.

A solution of 8-hydroxyquinoline-7-carboxylic acid (0.43 g) of Preparation 1 in 80 mL xylenes is heated to reflux. PCl_3 (0.12 mL) is added dropwise and the mixture stirred for 20 minutes. 2-Amino-5-(5-bromothiophen-2-yl)thiazole (0.62 g) is added in one portion and the reaction refluxed overnight. The reaction is cooled to room temperature and H_2O is added to quench excess PCl_3 . The solvents are removed and the residue is dissolved in acetic acid. A dark orange solid precipitates

upon addition of hexanes (0.28 g) to yield the title product.

Physical characteristics are as follows:

MP 279-281°C dec..

10 PREPARATION 6 5-Bromo-8-methoxy-2-methyl-7-quinolinesulfinic acid, lithium salt (Formula J-2 wherein R¹ = Me and X¹ = Br) Refer to Chart J.

15 Under N₂, a flame-dried, 250-mL, three-necked flask with attached addition funnel and bubbler is charged with 5,7-dibromo-8-methoxy-2-methyl-quinoline (3 g), ether (18 mL) and toluene (18 mL). The flask is cooled in a dry ice / acetone bath, degassed and flushed with N₂. To facilitate stirring, additional ether (5 mL) and toluene (5 mL) are added. The addition funnel is charged with 1.6 M nBuLi (5.6 mL) which is then added dropwise over 7 min to the thick slurry. The reaction mixture is stirred at -78°C for 3 hrs. Sulfur dioxide is then introduced via a needle positioned directly above the reaction surface. Within 5 min, the reaction mixture becomes a pale yellow opaque solution, and SO₂ introduction is terminated. The reaction mixture is flushed with N₂, the cooling bath is removed, and the reaction mixture is allowed to warm to room temperature over 1 hr. 100 mL hexane is added to aid precipitation of the solid, which is then collected by filtration. Drying under vacuum yields 2.844 g of the title compound as a yellow solid.

30 PREPARATION 7 5-Bromo-8-methoxy-2-methyl-7-quinolinesulfonyl chloride (Formula J-3 wherein R¹ = Me and X¹ = Br) Refer to Chart J.

5

Under N_2 , a flame-dried, 250-mL, three-necked flask is charged with the title compound of Preparation 6 (2.844 g) and CH_2Cl_2 (45 mL). The flask is cooled in an ice bath and N-chlorosuccinimide (1.178 g) is added in one portion. After 5 min, the cooling bath is removed and the reaction mixture is stirred for 3 hrs. The reaction mixture is then poured into H_2O , a small amount of brine is added, and the layers are separated. The aqueous layer is extracted with two portions CH_2Cl_2 . The combined organic layers are washed with brine, dried over $MgSO_4$, filtered and concentrated to give the title compound as a pale orange solid, which is immediately used in the preparation of compounds of the formula J-4.

- 15 PREPARATION 8 5-Bromo-N-[(4-chlorophenyl)methyl]-8-methoxy-2-methyl-7-quinolinesulfonamide (Formula J-4 wherein $R^1 = Me$, $X^1 = Br$, and $R^2 = CH_2-4-ClC_6H_4$) Refer to Chart J.

20

Under N_2 , a flame-dried, 250-mL, three-necked flask is charged with 4-chlorobenzylamine (980 μL), pyridine (1.3 mL), and CH_2Cl_2 (10 mL). The title compound of Preparation 7 in 55 mL CH_2Cl_2 is transferred via cannula to the reaction flask and then is allowed to stir overnight at room temperature. The reaction mixture is concentrated and the residue is taken up in toluene and concentrated twice. Purification by column chromatography (elution with 0.5% MeOH / CH_2Cl_2) affords 1.47 g of the title compound as a yellow foam.

5

A flame-dried, 100-mL, one-necked flask with attached oven-dried condensor is charged with the title compound of Preparation 8 (0.640 g) and pyridine hydrochloride (8.8 g). The reaction mixture is heated to 215-220°C for 10 min., and then is poured onto ice. It is neutralized with saturated aqueous NaHCO_3 and extracted with CH_2Cl_2 three times. The combined organic layers are washed with brine, dried over MgSO_4 , filtered and concentrated. The residue is taken up in toluene and concentrated four times. Crystallization from CH_2Cl_2 / Et_2O provides 0.247 g of the title compound as an off-white solid.

Physical characteristics are as follows:

MP 158-161°C (decompose).

^1H NMR (300 MHz, CDCl_3) δ 8.44, 7.88, 7.56, 7.13-7.05, 5.42, 4.14, 2.80 ppm.

A flame-dried, 50-mL, three-necked flask is charged with 5-chloro-8-hydroxy-7-iodoquinoline (2.814 g), which is commercially available, t-butyldimethylchlorosilane (1.76 g), and 10 mL of DMF. Imidazole (1.66 g) is added, and the resulting mixture is stirred at room temperature for 18 h. The reaction mixture is then quenched with 10 mL of saturated aqueous NaHCO_3 and extracted with hexane three times. The combined organic layers are dried over MgSO_4 , filtered and concentrated to give 3.898 g of the title compound as a pale green solid.

A flame-dried, 25-mL, two-necked flask is charged with the title compound of Preparation 11 (0.431 g) and 7 mL of THF. The resulting solution is cooled to -78 °C, and t-butyllithium (1.2 mL of 1.7 M solution in pentane) is added dropwise over 2 min. The reaction mixture is stirred for an additional 15 min at -78 °C, the quenched by pouring into 5 mL of half-saturated NH₄Cl (aq). The mixture is extracted with 50 mL of EtOAc. The organic layer is separated, washed with 15 mL of saturated NaHCO₃ (aq), dried over MgSO₄, filtered and concentrated to give 0.289 g of an off-white solid. Column chromatography (elution with 2% EtOAc/hexane) yields 0.101 g of the title compound as a white solid.

PREPARATION 14 8-Hydroxy-2-[2-(4-methoxyphenyl)ethenyl]-7-quinolinecarboxylic acid

The title compound of Preparation 12 (3.00 g) is mixed with K₂CO₃ (4.51 g) and loaded into a small stainless steel bomb. The bomb is flushed 3X with 100 psi CO₂ and then pressurized to the pressure of the CO₂ tank. The bomb is heated at 170°C for 7 days, maintaining a final pressure of approximately 1200 psi. The bomb is de-pressurized and cooled to room temperature. The residue is dissolved in a minimal amount of warm water. The aqueous mixture is acidified with concentrated HCl. The material which precipitates at pH 7 (starting material) is filtered and the filtrate is further acidified to pH 4. The product is obtained as a yellow/orange solid which is further purified by trituration in iPrOH (0.74 g).

PREPARATION 17 4-Chloro-8-methoxy-2-(trifluoromethyl)quinoline

4-Hydroxy-8-methoxy-2-trifluoromethylquinoline (18.77 g) is dissolved in 450
25 mL 8:1 CH_2Cl_2 :DMF. POCl_3 (50 mL) is added dropwise and the reaction is allowed to stir overnight. The reaction is then poured into 500 mL ice/ H_2O and the aqueous is extracted 2X with CH_2Cl_2 . The organic portions are combined, washed 1X with brine, dried over MgSO_4 , and evaporated. The resulting oil crystallizes upon
30 standing. The solid is recrystallized from 95% EtOH. A second crop of crystals could be obtained by concentrating down the EtOH filtrate. The total yield of product is 15.36 g.

PREPARATION 19 8-Hydroxy-2-(trifluoromethyl)-7-quinolinecarboxylic acid

15 8-Hydroxy-2-trifluoromethylquinoline (3.2 g) and K₂CO₃ (6.22 g) are placed in a stainless steel bomb. The bomb is pressurized slightly with CO₂ and flushed 3X, then pressurized to approximately 800 psi CO₂. The bomb is heated to 170°C, reaching a final pressure of approximately 1200 psi. This temperature and pressure are maintained for 7 days after which time the bomb is cooled and the pressure
20 released. The solid residue is dissolved in a minimal amount of warm water. Any undissolved material is filtered and the aqueous filtrate is acidified to pH 4 with conc. HCl. The resulting tan solid is filtered and dried. The product is recrystallized with Et₂O to give a light tan solid (1.87 g).

10 PREPARATION 20 4,8-Dihydroxy-2-(trifluoromethyl)-7-quinolinecarboxylic acid

2-Trifluoromethyl-4,8-dihydroxyquinoline (6.0 g) and K₂CO₃ (11.0 g) are mixed in a stainless steel bomb. The bomb is flushed and evacuated 3X with 100 psi CO₂. The reaction vessel is then pressurized to 800 psi CO₂ and heated to 170°C, reaching a final pressure of 1200 psi. The bomb remains at this temperature and pressure for 7 days. The reaction vessel is cooled to room temperature, the pressure is released, and the reaction mixture is dissolved in 300 mL hot water. Any undissolved material is filtered and the filtrate is acidified with conc. HCl. A precipitate at pH 7 is collected (starting material). The filtrate is further acidified to pH 4 where a tan solid is collected (starting material + desired product). Since most of the solid collected is starting material, this material is reacted in the bomb for 7 more days. The same workup as before is done, with the only precipitate collected at pH 4.5. The desired product is filtered, dried, and recrystallized very slowly with EtOAc/hexanes (0.41 g).

35 PREPARATION 23 5-Chloro-8-hydroxy-2-methyl-7-quinolinesulfonyl flouride
(Formula P-2) Refer to Chart P.

5 A solution of 5-chloro-8-hydroxy-2-methylquinoline (9.2 g) in 55 mL of fluorosulfonic acid is stirred at 120 °C for 18 h in a tightly stoppered flask. The mixture is then cooled to -78 °C and poured onto an intimate mixture of 250 mL of crushed ice and 250 mL of powdered dry ice. The mixture is allowed to warm to 25 °C, and then diluted with distilled water until further addition causes no additional
10 solid to precipitate (ca. 100 mL). The mixture is filtered, and the solid obtained is washed with four 50 mL-portions of 0 °C distilled water and then dried in a stream of air to give 10.7 g of the title compound as an orange powder.

Physical characteristics are as follows:

25

A solution of 5-chloro-8-hydroxy-7-iodo-2-methylquinoline (30.8 g) in 500 mL of THF is cooled to -78 °C, and methyl magnesium bromide (34.4 mL of 3.0 M solution in ether) is added over 12 min. The resulting mixture is stirred for 20 min, then n-butyllithium (65 mL of 1.6 M solution in pentane) is added over 25 min. The reaction mixture is allowed to stir at -78°C for 2 h, then SO₂ (g) is introduced via a needle positioned above the reaction surface. After 42 min, the reaction mixture turns a yellow opaque color and gas introduction is terminated (pH = 5-6). Sat'd

NaHCO_3 (aq) is added until the pH = 8, and the precipitate is collected by filtration. The aqueous layer of the filtrate is separated, and the pH is adjusted to 4 with 10% HCl (aq). Gradually, a precipitate forms. This is collected by filtration to afford 8.73 g of the title compound as an orange solid.

5 Physical characteristics are as follows:

15 N-Chlorosuccinimide (2.07 g) is added to a solution of the title compound of Preparation 26 (4.0 g) in 70 mL of CH_2Cl_2 , and the resulting mixture is stirred at room temperature for 2 h. The yellow-orange solid precipitate is collected by filtration and dried under vacuum at 56°C for 1.5 h to afford 2.75 g of the title compound, which is used immediately without further purification.

20 PREPARATION 28 5-Chloro-8-hydroxy-2-methyl-N-[2-(4-aminophenyl)ethyl]-7-quinolinesulfonamide (Formula R-5) Refer to Chart R.

25

A solution of the title compound of Preparation 27 (1.51 g), 2-(4-aminophenyl)ethylamine (0.68 mL), and pyridine (0.83 mL) in 30 mL of CH_2Cl_2 is stirred at room temperature for 18 h. The resulting precipitate is isolated by filtration and
30 rinsed with CH_2Cl_2 to give 1.82 g of the title compound as an orange solid which is used without further purification.

Physical characteristics are as follows:

MP $249\text{--}253^\circ\text{C}$;

5

A solution of the title compound of Preparation 28 (0.62 g) and 3,5-dimethyl-
isoxazole-4-sulfonyl chloride (0.31 mL) in 5 mL of pyridine is stirred at room
temperature for 54 h. Additional sulfonyl chloride (0.31 mL) is added at 18 h and 36
h. The reaction mixture is then concentrated in vacuo, and the residue is
partitioned between EtOAc, pH 4 phosphate buffer and water. The organic layer is
separated and concentrated in vacuo to give 1.22 g of an orange solid. Column
chromatography on 75 g of silica gel (elution with 0-20% MeOH/CHCl₃) followed by
crystallization from CH₂Cl₂/hexanes provides 0.041 g of the title compound as a
yellow solid.

35

A suspension of 5-fluoro-8-hydroxy-7-quinolinesulfonyl chloride (0.150 g) in 2 mL of THF is cooled to -78 °C and treated with benzylamine (0.186 mL). The mixture is allowed to warm to 25 °C over several hours, then diluted with 50 µL of glacial acetic acid and 2 mL of distilled water. The oil which forms is crystallized by scratching, and the resulting suspension is stirred for one hour. The solid is filtered, washed with two 2 mL portions of distilled water and dried in a stream of air to give 0.121 g of the title compound as a solid.

Physical characteristics are as follows:

MP 185.5-186 °C;

¹H NMR (400 MHz, DMSO) δ 9.04, 8.48, 8.03, 7.81, 7.47, 7.22, 7.11, 7.03, 4.12;

EXAMPLE 68 5-Chloro-N-[(4-chlorophenyl)methyl]-8-hydroxy-2-methyl-7-quinolinecarboxamide

To a solution of 5-chloro-8-hydroxy-2-methyl-7-quinolinecarboxylic acid (0.500 g) and 4-chlorobenzylamine (0.28 mL) in 20 mL DMF is added EDC hydrochloride (0.444 g) and hydroxybenzotriazole hydrate (0.312 g). The reaction is stirred at room temperature for 48 h. The mixture is then partitioned between EtOAc and water. The aqueous layer is extracted with EtOAc (3X). The combined organic layers are washed with brine (1X), dried over sodium sulfate and condensed. The residue is stirred in 20 mL 1:1 THF/1N HCl overnight. The solution is neutralized with saturated aqueous NaHCO₃. The reaction is partitioned between EtOAc and water. The aqueous layer is extracted with EtOAc (3X). The combined organic layers are washed with brine (1X), dried and condensed. The crude product is chromatographed on silica, eluting with 3% MeOH/CH₂Cl₂. Fractions homogeneous by TLC are combined and condensed. The residue taken up in a minimal amount of CH₂Cl₂. Toluene is added to the solution and the mixture is sonicated while adding hexanes until a white solid formed. The solid is collected and dried to yield 0.310 g of the title product as a white solid.

PREPARATION 30 8-Hydroxyquinoline, 7-carboxylic acid (formula T-2) Refer to Chart T.

A finely ground mixture of 27.8 g of 8-hydroxyquinoline (T-1) and 79.2 g of potassium carbonate is placed in a bomb and heated to 175° C under 800 psi carbon
25 dioxide gas. After seven days, the reaction is cooled to room temperature. The resulting mixture is treated with 1.2 L of hot water to dissolve most of the material. The suspension is filtered, cooled to room temperature and acidified to pH=7 with concentrated hydrochloric acid. The precipitate is removed by filtration. The filtrate is acidified to pH=3.5 with concentrated hydrochloric acid. The new precipitate is
30 collected by suction filtration, washed with repeatedly isopropanol followed by hexanes. The yellow solid is dried in vacuo to afford 26 g of the title acid.

Physical characteristics are as follows:

¹H-NMR (DMSO): 8.9, 8.6, 7.9, 7.8, 7.3.

EXAMPLE 74 N-[2-(3-Chlorophenyl)ethyl]-8-hydroxy-7-quinolinecarboxamide
35 (uninverted CAS name) (formula T-3 wherein R^o is 2-(3-chlorophenyl)ethyl) Refer to Chart T.

To a suspension of 1.89 g of T-2 of Preparation 30, 1.50 g of 1-hydroxybenzotriazole and 2.30 g of 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride in 50 mL of dichloromethane is added 1.55 mL of 2-(3-chlorophenyl)ethylamine. The reaction is stirred overnight at room temperature. The
5 resulting orange solution is diluted with dichloromethane and partitioned against saturated aqueous sodium bicarbonate. The aqueous phase is extracted with additional portions of dichloromethane. The organic layers are combined and washed with pH=4 aqueous phosphate buffer followed by brine. The organic phase is dried over anhydrous magnesium sulfate, filtered and concentrated under reduced
10 pressure. The residue is crystallized from ethyl acetate to afford 2.55 g of the title compound.

Physical characteristics are as follows:

PREPARATION 31 N-Aryl-8-hydroxy-7-quinolinecarboxamides from anhydride U-1,
procedure for single compounds (GP II) (Refer to Chart U):

Anhydride U-1 (1 eq.) is dissolved in CHCl_3 (n mL) at r.t. Pyridinium chloride
35 (1 eq) and then the arylamine (about 1 eq.) are added. The solution is stirred for 6 h
at r.t. 1M $\text{HCl}/\text{H}_2\text{O}$ (n mL) is added and the biphasic mixture is stirred efficiently

overnight. The precipitate is filtered, washed with a little water and CH_2Cl_2 and dried under high vacuum.

PREPARATION 32 N-Aryl-8-hydroxy-7-quinolinecarboxamides from anhydride U-1, procedure for parallel synthesis (GP III) (Refer to Chart U):

5 The aryl amines (0.20 mmol) are laid into syringes corked at their output and set with a frit at the bottom of their large section. A sol. of anhydride U-1 (0.1M) and pyridinium chloride (0.1M) in CHCl_3 is prepared. This solution (2 mL/syringe) is added into the syringes; if the arylamine is a liquid, it is added at this stage only; if the arylamine is a hydrochloride salt, DIPEA (33 μL , 1 eq) is added. The syringes
10 are tightly closed at their bottoms and shaken for 6 h at r.t. 1M $\text{HCl}/\text{H}_2\text{O}$ (2 mL) is added and the biphasic mixture is shaken efficiently overnight. The precipitate is isolated by sucking the solvent from the bottom of the syringes, washed with a little water and CH_2Cl_2 and dried under high vacuum.

PREPARATION 33 N-Aryl-8-hydroxy-7-quinolinecarboxamides from the ester U-3, procedure for single compounds (GP IV) (Refer to Chart U):

15 Ester U-3 is dissolved in CH_2Cl_2 and the arylamine (about 1 eq) and DIPEA (about 1 eq.) are added. The reaction mixture is stirred between 6 h and 6 days. MeOH (same amount as CH_2Cl_2) is added and the mixture is stirred between 6 h and 18 h. For the work-up procedures, see specific examples below.

20 PREPARATION 34 N-Aryl-8-hydroxy-7-quinolinecarboxamides from ester U-3, procedure for parallel synthesis (GP V) (Refer to Chart U):

The aryl amines (0.2 mmol) are put into syringes corked at their output and set with a frit at the bottom of their large section. A sol. of ester 3 (0.05M) and DIPEA (0.05M) in CH_2Cl_2 is prepared and added to the arylamines (4 mL for each
25 amine); if the arylamine is a liquid, it is added at this stage only; if the arylamine is a salt, DIPEA (33 μL , 1 eq) is added. The syringes are tightly closed and shaken for 5 days. MeOH (2-4 mL) is added and the mixture is shaken for 6 h. The precipitate, if any, is isolated by sucking the solvent from the bottom of the syringes, washed with AcOEt and dried under high vacuum (P-fraction). The filtrate is
30 washed with sat. $\text{NaHCO}_3/\text{H}_2\text{O}$ (1x) and an aq. buffer sol. at pH4 (1x); each time, the aq. phase is pipetted out of the syringe. If a precipitate appears during the work-up, it is filtered and dried (WU-fraction). The filtrate is blown down with a nitrogen stream; AcOEt (4 mL) is added and the mixture heated to 65°C for 30 min. and cooled to 0°C. The solvent is pipetted out and the residue dried under high vacuum
35 (T-fraction). The org. phase is blown down and the residue dried under high

vacuum as well (S-fraction). The degree of hydration of the obtained products was not determined.

PREPARATION 35 8-[(2,2,2-Trichloroethoxy)carbonyloxy]-7-quinolinecarboxylic acid anhydride with 2,2,2-trichloroethyl hydrogen carbonate (U-1) (Refer to Chart U):

In a flame-dried flask, 8-hydroxy-7-quinolinecarboxylic acid (2.00 g) is suspended into CH_2Cl_2 (100 mL) and DIPEA (3.70 mL) is added. The mixture is stirred until homogeneity is reached and cooled to 0°C . Trichloroethyl chloroformate (3.00 mL) is added and the solution is stirred for 3 h at 0°C , then stirred for another hour while allowed to warm up slowly to r.t. The solution is washed with 1M $\text{HCl}/\text{H}_2\text{O}$ (1x), dried over Na_2CO_3 and the solvent removed under reduced pressure. Crystallization of the residue from CHCl_3 /hexanes yielded the desired product (5.20g).

Physical characteristics are as follows:

PREPARATION 37 7-(Fluorocarbonyl)-quinolin-8-yl acetate (U-3) (Refer to Chart U):

In a flame-dried flask under Ar, 8-acetoxy-7-quinolinecarboxylic acid U-2 (4.30 g) is suspended into CH_2Cl_2 (110mL). Pyridine (1.50 mL) is added and the suspension cooled to -40°C . Cyanuric fluoride (3.00 mL) is added and the mixture stirred for 3 h, while the temperature rose slowly to 0°C . Ice and water and CH_2Cl_2 (100mL) are added. Phases are shaken, separated and the aq. phase extracted with

CH₂Cl₂ (1x). The combined org. phases are dried over MgSO₄, filtered, and the solvent is removed under reduced pressure. Crystallization of the residue from hexanes yielded ester U-3 as white needles (4.10 g).

MS (ES) m/z Pos. mode: 333, 335, 337 (MH⁺); neg. mode: 331, 333, 335 (M-H⁺). Contaminated with carbamate.

30 EXAMPLE 173 N-(3,5-Dichlorophenyl)-8-hydroxy-7-quinolinecarboxamide monohydrochloride (V-25) (Refer to Chart V):

Following GP III starting from 3,5-dichloroaniline (33 mg).

Physical characteristics are as follows:

35 MS (ES) m/z Pos. mode: 333, 335, 337 (MH⁺); neg. mode: 331, 333, 335 (M-H⁺).

EXAMPLE 174 8-Hydroxy-N-(3-iodophenyl)-7-quinolinecarboxamide
monohydrochloride (V-26) (Refer to Chart V):

Following GP III starting from 3-iodoaniline (44 mg).

Physical characteristics are as follows:

5 MS (ES) m/z Pos. mode: 391 (MH⁺); neg. mode: 389 (M-H⁺).

EXAMPLE 175 N-(3-Benzoxyphehyl)-8-hydroxy-7-quinolinecarboxamide
monohydrochloride (V-27) (Refer to Chart V):

Following GP III starting from 3-benzoxylaniline (40 mg).

Physical characteristics are as follows:

10 MS (ES) m/z Pos. mode: 371 (MH⁺); neg. mode: 369 (M-H⁺).

EXAMPLE 176 8-Hydroxy-N-[3-(methylmercapto)phenyl]-7-
quinolinecarboxamide monohydrochloride (V-28) (Refer to Chart
V):

Following GP III starting from 3-(methylmercapto)aniline (25 µL).

15 Physical characteristics are as follows:

MS (ES) m/z Pos. mode: 311 (MH⁺); neg. mode: 309 (M-H⁺).

EXAMPLE 177 N-(3,5-Dimethylphenyl)-8-hydroxy-7-quinolinecarboxamide
monohydrochloride (V-29) (Refer to Chart V):

Following GP III starting from 3,5-dimethylaniline (25 µL).

20 MS (ES) m/z: Pos. mode: 293 (MH⁺); neg. mode: 291 (M-H⁺).

EXAMPLE 178 N-(4-Bromophenyl)-8-hydroxy-7-quinolinecarboxamide
monohydrochloride (V-30) (Refer to Chart V):

Following GP III starting from 4-bromoaniline (35 mg).

Physical characteristics are as follows:

25 MS (ES) m/z Pos. mode: 343, 345 (MH⁺); neg. mode: 341, 343 (M-H⁺).

Contaminated with carbamate.

EXAMPLE 179 8-Hydroxy-N-(4-phenoxyphenyl)-7-quinolinecarboxamide
monohydrochloride (V-31) (Refer to Chart V):

Following GP III starting from 4-phenoxyaniline (37 mg).

30 Physical characteristics are as follows:

MS (ES) m/z Pos. mode: 357 (MH⁺); neg. mode: 355 (M-H⁺).

EXAMPLE 180 N-(3,5-Dichloro-4-hydroxyphenyl)-8-hydroxy-7-
quinolinecarboxamide monohydrochloride (V-32) (Refer to Chart
V):

35 Following GP III starting from 3,5-dichloro-4-hydroxyaniline (36 mg).

MS (ES) m/z: Pos. mode: 349, 351, 353 (MH⁺); neg. mode: 347, 349, 351 (M-H⁺).

EXAMPLE 181 8-Hydroxy-N-biphen-4-yl-7-quinolinecarboxamide
monohydrochloride (V-33) (Refer to Chart V):

5 Following GP III starting from 4-aminobiphenyl (34 mg).

Physical characteristics are as follows:

MS (ES) m/z Pos. mode: 341 (MH⁺); neg. mode: 339 (M-H⁺).

EXAMPLE 182 8-Hydroxy-N-[4-(4-nitrophenylmercapto)phenyl]-7-
quinolinecarboxamide monohydrochloride (V-34) (Refer to Chart
10 V):

Following GP III starting from 4-(4-nitrophenylmercapto)aniline (49 mg).

Physical characteristics are as follows:

MS (ES) m/z Pos. mode: 418 (MH⁺); neg. mode: 416 (M-H⁺).

EXAMPLE 183 N-(4-Benzoxyphephenyl)-8-hydroxy-7-quinolinecarboxamide
15 monohydrochloride (V-35) (Refer to Chart V):

Following GP III starting from 4-benzoxylaniline (47 mg).

Physical characteristics are as follows:

MS (ES) m/z Pos. mode: 371 (MH⁺); neg. mode: 369 (M-H⁺).

EXAMPLE 184 8-Hydroxy-N-[4-(4-nitrophenoxy)phenyl]-7-
20 quinolinecarboxamide monohydrochloride (V-36) (Refer to Chart
V):

Following GP III starting from 4-(4-nitrophenoxy)aniline (46 mg).

Physical characteristics are as follows:

MS (ES) m/z Pos. mode: 402 (MH⁺); neg. mode: 400 (M-H⁺).

25 EXAMPLE 185 N-(4-cyclohexylphenyl)-8-hydroxy-7-quinolinecarboxamide
monohydrochloride (V-37) (Refer to Chart V):

Following GP V starting from 4-cyclohexylaniline (35 mg).

Physical characteristics are as follows:

MS (ES) m/z Pos. mode: 347 (MH⁺); neg. mode: 345 (M-H⁺).

30 EXAMPLE 186 8-Hydroxy-N-naphth-1-yl-7-quinolinecarboxamide (V-38) (Refer
to Chart V):

Following GP V starting from 1-aminonaphthalene (29 mg).

Physical characteristics are as follows:

MS (ES) m/z T-fraction: Pos. mode: 315 (MH⁺); neg. mode: 313 (M-H⁺).

35 EXAMPLE 187 N-(4-Bromonaphth-1-yl)-8-hydroxy-7-quinolinecarboxamide (V-
39) (Refer to Chart V):

Following GP V starting from 1-amino-4-bromonaphthalene (44 mg).

Physical characteristics are as follows:

MS (ES) m/z P-fraction: Neg. mode: 391 and 393 (M-H⁺).

5 EXAMPLE 188 8-Hydroxy-N-(2-pyrrol-1-ylphenyl)-7-quinolinecarboxamide (V-40) (Refer to Chart V):

Following GP V starting from 1-(2-aminophenyl)pyrrole (32 mg).

Physical characteristics are as follows:

MS (ES) m/z T-fraction: Pos. mode: 330 (MH⁺); neg. mode: 328 (M-H⁺).

10 EXAMPLE 189 8-Hydroxy-N-indol-5-yl-7-quinolinecarboxamide (V-41) (Refer to Chart V):

Following GP V starting from 5-aminoindole (26 mg).

Physical characteristics are as follows:

MS (ES) m/z P- and WU-fractions: Pos. mode: 304 (MH⁺); neg. mode: 302 (M-H⁺).

15 EXAMPLE 190 N-Benzo-2,1,3-thiadiazol-4-yl-8-hydroxy-7-quinolinecarboxamide (V-42) (Refer to Chart V):

Following GP V starting from 4-aminobenzo-2,1,3-thiadiazole (30 mg).

Physical characteristics are as follows:

MS (ES) m/z P-fraction: neg. mode: 302 (M-H⁺).

20 EXAMPLE 191 8-Hydroxy-N-quinolin-5-yl-7-quinolinecarboxamide (V-43) (Refer to Chart V):

Following GP V starting from 5-aminoquinoline (29 mg).

Physical characteristics are as follows:

25 MS (ES) m/z P- and WU-fractions: Pos. mode: 316 (MH⁺) and 338 (MNa⁺); neg. mode: 314 (M-H⁺).

EXAMPLE 192 8-Hydroxy-N-quinolin-8-yl-7-quinolinecarboxamide (V-44) (Refer to Chart V):

Following GP V starting from 8-aminoquinoline (29 mg).

Physical characteristics are as follows:

30 MS (ES) m/z P-fraction: Pos. mode: 316 (MH⁺); neg. mode: 314 (M-H⁺).

EXAMPLE 193 8-Hydroxy-N-isoquinolin-5-yl-7-quinolinecarboxamide (V-45) (Refer to Chart V):

Following GP V starting from 5-aminoisoquinoline (29 mg).

Physical characteristics are as follows:

35 MS (ES) m/z P-fraction: Pos. mode: 316 (MH⁺); neg. mode: 314 (M-H⁺).

EXAMPLE 194 8-Hydroxy-N-(4-methoxy-2-nitrophenyl)-7-quinolinecarboxamide

(V-46) (Refer to Chart V):

Following GP V starting from 4-methoxy-2-nitroaniline (34 mg).

Physical characteristics are as follows:

5 MS (ES) m/z P-fraction: Neg. mode: 338 (M-H⁺). Contaminated with
quinoline methyl ester.

EXAMPLE 195 8-Hydroxy-N-[2-nitro-4-(trifluoromethyl)phenyl]-7-
quinolinecarboxamide (V-47) (Refer to Chart V):

Following GP V starting from 2-nitro-4-(trifluoromethyl)aniline (41 mg).

Physical characteristics are as follows:

10 MS (ES) m/z P-fraction: Pos mode: 378 (MH⁺); neg. mode: 338 (M-H⁺).

EXAMPLE 196 N-(3,5-Dinitrophenyl)-8-hydroxy-7-quinolinecarboxamide (V-48)
(Refer to Chart V):

Following GP V starting from 3,5-dinitroaniline (37 mg).

Physical characteristics are as follows:

15 MS (ES) m/z: P-fraction: Neg. mode 353 (M-H⁺).

EXAMPLE 197 8-Hydroxy-N-[4-nitro-2-(trifluoromethyl)phenyl]-7-
quinolinecarboxamide (V-49) (Refer to Chart V):

Following GP V starting from 4-nitro-2-(trifluoromethyl)aniline (41 mg).

Physical characteristics are as follows:

20 MS (ES) m/z: P-fraction Pos. mode: 378 (MH⁺), 400 (MNa⁺); neg. mode: 376
(M-H⁺).

EXAMPLE 198 N-(2-Cyanophenyl)-8-hydroxy-7-quinolinecarboxamide (V-50)
(Refer to Chart V):

Following GP V starting from 2-aminobenzonitrile (24 mg).

25 Physical characteristics are as follows:

MS (ES) m/z P-fraction: Pos. mode: 290 (MH⁺), 312 (MNa⁺); neg. mode: 388
(M-H⁺).

EXAMPLE 199 N-(2-Bromophenyl)-8-hydroxy-7-quinolinecarboxamide (V-51)
(Refer to Chart V):

30 Following GP V starting from 2-bromoaniline (35 mg).

Physical characteristics are as follows:

MS (ES) m/z T-fraction: Pos. mode: 343 and 345 (MH⁺); neg. mode: 341 and
343 (M-H⁺).

EXAMPLE 200 N-(2,4-Dibromophenyl)-8-hydroxy-7-quinolinecarboxamide (V-
35 52) (Refer to Chart V):

Following GP V starting from 2,4-dibromoaniline (50 mg).

Physical characteristics are as follows:

MS (ES) m/z P-fraction: Neg. mode: 419, 421 and 423 (M-H⁺). Contaminated with 8-hydroxy-7-quinoline carboxylic acid.

EXAMPLE 201 N-(2,5-Dibromophenyl)-8-hydroxy-7-quinolinecarboxamide (V-53) (Refer to Chart V):

Following GP V starting from 2,5-dibromoaniline (50 mg).

Physical characteristics are as follows:

MS (ES) m/z P-fraction: Pos. mode: 421, 423 and 425 (MH⁺); neg. mode: 419, 421 and 423 (M-H⁺).

EXAMPLE 202 N-(2-Fluorophenyl)-8-hydroxy-7-quinolinecarboxamide (V-54) (Refer to Chart V):

Following GP V starting from 2-fluoroaniline (22 mg).

Physical characteristics are as follows:

MS (ES) m/z P-fraction: Pos. mode: 283 (MH⁺), 305 (MNa⁺); neg. mode: 281 (M-H⁺).

EXAMPLE 203 N-(4-Cyano-2,3,5,6-tetrafluorophenyl)-8-hydroxy-7-quinolinecarboxamide (V-55) (Refer to Chart V):

Following GP V starting from 4-amino-2,3,5,6-tetrafluorobenzonitrile (38 mg).

Physical characteristics are as follows:

MS (ES) m/z T-fraction: Pos. mode: 362 (MH⁺); neg. mode: 260 (M-H⁺).

EXAMPLE 204 N-(2,4-Difluorophenyl)-8-hydroxy-7-quinolinecarboxamide (V-56) (Refer to Chart V):

Following GP V starting from 2,4-difluoroaniline (26 mg).

Physical characteristics are as follows:

MS (ES) m/z P-fraction: Pos. mode: 301 (MH⁺), 323 (MNa⁺); neg. mode: 299 (M-H⁺).

EXAMPLE 205 8-Hydroxy-N-(2,4,5-trifluorophenyl)-7-quinolinecarboxamide (V-57) (Refer to Chart V):

Following GP V starting from 2,4,5-trifluoroaniline (30 mg).

Physical characteristics are as follows:

MS (ES) m/z T-fraction: Pos. mode: 319 (MH⁺); neg. mode: 317 (M-H⁺).

EXAMPLE 206 N-(2-Chlorophenyl)-8-hydroxy-7-quinolinecarboxamide (V-58) (Refer to Chart V):

Following GP V starting from 2-chloroaniline (26 mg).

Physical characteristics are as follows:

MS (ES) m/z T-fraction: Pos. mode: 299 and 301 (MH⁺); neg. mode: 297 and

299 (M-H⁺). Contaminated with quinoline methyl ester.

EXAMPLE 207 N-(4-Bromo-2-chlorophenyl)-8-hydroxy-7-quinolinecarboxamide
(V-59) (Refer to Chart V):

Following GP V starting from 4-bromo-2-chloroaniline (42 mg).

5 Physical characteristics are as follows:

MS (ES) m/z P-fraction: Pos. mode: 377, 379 and 381 (MH⁺); neg. mode: 375,
377 and 379 (M-H⁺).

EXAMPLE 208 N-(2,4-Dichlorophenyl)-8-hydroxy-7-quinolinecarboxamide (V-
60) (Refer to Chart V):

10 Following GP V starting from 2,4-dichloroaniline (32 mg).

Physical characteristics are as follows:

MS (ES) m/z P-fraction: Pos. mode: 333, 335 and 337 (MH⁺); neg. mode: 331,
333 and 335 (M-H⁺).

EXAMPLE 209 N-(2-Chloro-4-nitrophenyl)-8-hydroxy-7-quinolinecarboxamide
15 (V-61) (Refer to Chart V):

Following GP V starting with 2-chloro-4-nitroaniline (35 mg).

Physical characteristics are as follows:

MS (ES) m/z P-fraction: Neg. mode: 342 and 344 (M-H⁺).

EXAMPLE 210 N-(2,5-Dichlorophenyl)-8-hydroxy-7-quinolinecarboxamide (V-
20 62) (Refer to Chart V):

Following GP V starting from 2,5-dichloroaniline (33 mg).

Physical characteristics are as follows:

MS (ES) m/z P-fraction Pos. mode: 333, 335 and 337 (MH⁺); neg. mode: 331,
333 and 335 (M-H⁺).

25 EXAMPLE 211 N-(2-Chloro-5-methylphenyl)-8-hydroxy-7-quinolinecarboxamide
(V-63) (Refer to Chart V):

Following GP V starting from 2-chloro-5-methylaniline (29 mg).

Physical characteristics are as follows:

30 MS (ES) m/z T-fraction: Pos. mode: 313 and 315 (MH⁺); neg. mode: 311 and
313 (M-H⁺).

EXAMPLE 212 8-Hydroxy-N-(2-iodophenyl)-7-quinolinecarboxamide (V-64)
(Refer to Chart V):

Following GP V starting from 2-iodoaniline (44 mg).

Physical characteristics are as follows:

35 MS (ES) m/z T-fraction: Pos. mode: 391 (MH⁺); neg. mode: 389 (M-H⁺).

Contaminated with quinoline methyl ester.

EXAMPLE 213 8-Hydroxy-N-(2-nitrophenyl)-7-quinolinecarboxamide (V-65)
(Refer to Chart V):

Following GP V starting from 2-nitroaniline (28 mg).

Physical characteristics are as follows:

5 MS (ES) m/z T-fraction: Neg. mode: 308 (M-H⁺), 331 (MNa-H⁺).

Contaminated with quinoline methyl ester.

EXAMPLE 214 N-(5-Chloro-2-hydroxyphenyl)-8-hydroxy-7-
quinolinecarboxamide (V-66) (Refer to Chart V):

Following GP V starting from 5-chloro-2-hydroxyaniline (29 mg).

10 Physical characteristics are as follows:

MS (ES) m/z P-fraction: Pos. mode: 357 and 359 (MH⁺), 379 and 381 (MNa⁺);
neg. mode: 355 and 357 (M-H⁺).

EXAMPLE 215 8-Hydroxy-N-(2-hydroxy-5-nitrophenyl)-7-quinolinecarboxamide
(V-67) (Refer to Chart V):

15 Following GP V starting from 2-hydroxy-5-nitroaniline (31 mg).

Physical characteristics are as follows:

MS (ES) m/z P-fraction: Neg. mode: 324 (M-H⁺).

EXAMPLE 216 8-Hydroxy-N-(2-hydroxy-5-methylphenyl)-7-
quinolinecarboxamide (V-68) (Refer to Chart V):

20 Following GP V starting from 2-hydroxy-5-methylaniline (25 mg).

Physical characteristics are as follows:

MS (ES) m/z WU-fraction: Pos. mode: 295 (MH⁺); neg. mode: 293 (M-H⁺).

EXAMPLE 217 N-Biphen-2-yl-8-hydroxy-7-quinolinecarboxamide (V-69) (Refer
to Chart V):

25 Following GP V starting from 2-aminobiphenyl (34 mg).

Physical characteristics are as follows:

MS (ES) m/z T-fraction: Pos. mode: 341 (MH⁺); neg. mode: 339 (M-H⁺).

EXAMPLE 218 8-Hydroxy-N-[2-(methylmercapto)phenyl]-7-
quinolinecarboxamide (V-70) (Refer to Chart V):

30 Following GP V starting from 2-methylmercaptoaniline (28 mg).

Physical characteristics are as follows:

MS (ES) m/z T-fraction: Pos. mode: 311 (MH⁺); neg. mode: 309 (M-H⁺).

EXAMPLE 219 8-Hydroxy-N-[2-(trifluoromethyl)phenyl]-7-
quinolinecarboxamide (V-71) (Refer to Chart V):

35 Following GP V starting from 2-(trifluoromethyl)aniline (33 mg).

Physical characteristics are as follows:

MS (ES) m/z T-fraction: Neg. mode: 331 (M-H⁺). Contaminated with quinoline methyl ester.

EXAMPLE 220 8-Hydroxy-N-(2-methylphenyl)-7-quinolinecarboxamide (V-72)
(Refer to Chart V):

5 Following GP V starting from 2-methylaniline (22 mg).

Physical characteristics are as follows:

MS (ES) m/z T-fraction: Pos. mode: 279 (MH⁺); neg. mode: 277 (M-H⁺).

EXAMPLE 221 8-Hydroxy-N-(2-methyl-3-nitrophenyl)-7-quinolinecarboxamide
(V-73) (Refer to Chart V):

10 Following GP V starting with 2-methyl-3-nitroaniline (31 mg).

Physical characteristics are as follows:

MS (ES) m/z T-fraction: Pos. mode: 324 (MH⁺); neg. mode: 322 (M-H⁺).

EXAMPLE 222 N-(2,3-Dimethylphenyl)-8-hydroxy-7-quinolinecarboxamide (V-
74) (Refer to Chart V):

15 Following GP V starting with 2,3-dimethylaniline (25 mg).

Physical characteristics are as follows:

MS (ES) m/z T-fraction: Pos. mode: 293 (MH⁺); neg. mode: 291 (M-H⁺).

EXAMPLE 223 8-Hydroxy-N-(2,4,6-trimethylphenyl)-7-quinolinecarboxamide
(V-75) (Refer to Chart V):

20 Following GP V starting from 2,4,6-trimethylaniline (25 mg).

Physical characteristics are as follows:

MS (ES) m/z T- and WU-fractions: Pos. mode: 307 (MH⁺); neg. mode: 305
(M-H⁺).

EXAMPLE 224 N-(2-Ethylphenyl)-8-hydroxy-7-quinolinecarboxamide (V-76)
25 (Refer to Chart V):

Following GP V starting with 2-ethylaniline (25 mg).

Physical characteristics are as follows:

MS (ES) m/z T-fraction: Pos. mode: 293 (MH⁺); neg. mode: 291 (M-H⁺).

EXAMPLE 225 8-Hydroxy-N-[3-(trifluoromethyl)phenyl]-7-
30 quinolinecarboxamide (V-77) (Refer to Chart V):

Following GP V starting with 3-(trifluoromethyl)aniline (32 mg).

Physical characteristics are as follows:

MS (ES) m/z T-fraction: Pos. mode: 333 (MH⁺); neg. mode: 231 (M-H⁺).

EXAMPLE 226 8-Hydroxy-N-(2-methyl-4-fluorophenyl)-7-quinolinecarboxamide
35 (V-78) (Refer to Chart V):

Following GP V starting with 2-methyl-4-fluoroaniline (25 mg).

Physical characteristics are as follows:

MS (ES) m/z T-fraction: Pos. mode: 297 (MH⁺); neg. mode: 295 (M-H⁺).

EXAMPLE 227 N-(4-Chloro-2-methylphenyl)-8-hydroxy-7-quinolinecarboxamide
(V-79) (Refer to Chart V):

5 Following GP V starting with 2-chloro-2-methylaniline (29 mg).

Physical characteristics are as follows:

MS (ES) m/z P-fraction: Pos. mode: 313 and 315 (MH⁺), 335 and 335 (MNa⁺);
neg. mode: 311 and 313 (M-H⁺).

EXAMPLE 228 N-(4-Chloro-2-methoxy-5-methylphenyl)-8-hydroxy-7-
10 quinolinecarboxamide (V-80) (Refer to Chart V):

Following GP V starting with 4-chloro-2-methoxy-5-methylaniline (55 mg).

Physical characteristics are as follows:

MS (ES) m/z T-fraction: Pos. mode: 343 and 345 (MH⁺); neg. mode: 341 and
343 (M-H⁺).

15 EXAMPLE 229 N-(4-tert-Butylphenyl)-8-hydroxy-7-quinolinecarboxamide (V-81)
(Refer to Chart V):

Following GP V starting with 4-tert-butylaniline (31 mg).

Physical characteristics are as follows:

MS (ES) m/z T-fraction: Pos. mode: 321 (MH⁺); neg. mode: 319 (M-H⁺).

20 EXAMPLE 230 8-Hydroxy-N-(4-propylphenyl)-7-quinolinecarboxamide (V-82)
(Refer to Chart V):

Following GP V starting with 4-propylaniline (28 mg).

Physical characteristics are as follows:

MS (ES) m/z T-fraction: Pos. mode: 307 (MH⁺); neg. mode: 305 (M-H⁺).

25 EXAMPLE 231 N-(2,6-Di-i-propylphenyl)-8-hydroxy-7-quinolinecarboxamide (V-
83) (Refer to Chart V):

Following GP V starting from 2,6-di-i-propylaniline (36 mg).

Physical characteristics are as follows:

MS (ES) m/z T-fraction: Neg. mode: 347 (M-H⁺).

30 EXAMPLE 232 N-(4-Bromo-2-fluorophenyl)-8-hydroxy-7-quinolinecarboxamide
(V-84) (Refer to Chart V):

Following GP V starting from 4-bromo-2-fluoroaniline (31 mg).

Physical characteristics are as follows:

35 MS (ES) m/z T- and P-fractions: Pos. mode: 361 and 363 (MH⁺); neg. mode:
359 and 361 (M-H⁺).

EXAMPLE 233 8-Hydroxy-N-(2,3,4-trifluorophenyl)-7-quinolinecarboxamide (V-

85) (Refer to Chart V):

Following GP V starting from 2,3,4-trifluoroaniline (30 mg).

Physical characteristics are as follows:

MS (ES) m/z P-fraction: Pos. mode: 319 (MH⁺), 341 (MNa⁺); neg. mode: 317

5 (M-H⁺).

EXAMPLE 234 N-(2-Fluoro-4-iodophenyl)-8-hydroxy-7-quinolinecarboxamide
(V-86) (Refer to Chart V):

Following GP V starting from 2-fluoro-4-iodoaniline (48 mg).

Physical characteristics are as follows:

10 MS (ES) m/z T- and P-fractions: Pos. mode: 409 (MH⁺); neg. mode: 407 (M-H⁺).

EXAMPLE 235 8-Hydroxy-N-[4-(hydroxymethyl)phenyl]-7-
quinolinecarboxamide (V-87) (Refer to Chart V):

Following GP V starting from 4-(hydroxymethyl)aniline (29 mg).

15 Physical characteristics are as follows:

MS (ES) m/z P-fraction: Pos. mode: 295 (MH⁺); neg. mode: 293 (M-H⁺).

EXAMPLE 236 N-Benzo-1,3-thiazol-6-yl-8-hydroxy-7-quinolinecarboxamide (V-
88) (Refer to Chart V):

Following GP V starting from 6-amino-benzo-1,3-thiazole (31 mg).

20 Physical characteristics are as follows:

MS (ES) m/z P-fraction: Pos. mode: 322 (MH⁺); neg. mode: 320 (M-H⁺).

EXAMPLE 237 8-Hydroxy-N-indazol-5-yl-7-quinolinecarboxamide (V-89) (Refer
to Chart V):

Following GP V starting from 5-aminoindazole (27 mg).

25 Physical characteristics are as follows:

MS (ES) m/z P-fraction: Neg. mode: 303 (M-H⁺).

EXAMPLE 238 8-Hydroxy-N-[2-methoxy-5-(trifluoromethyl)phenyl]-7-
quinolinecarboxamide (V-90) (Refer to Chart V):

Following GP V starting from 2-methoxy-5-(trifluoromethyl)aniline (39 mg).

30 Physical characteristics are as follows:

MS (ES) m/z T-fraction: Pos. mode: 363 (MH⁺); neg. mode: 361 (M-H⁺).

EXAMPLE 239 8-Hydroxy-N-(5-iodo-2-methylphenyl)-7-quinolinecarboxamide
(V-91) (Refer to Chart V):

Following GP V starting with 5-iodo-2-methylaniline (47 mg).

35 Physical characteristics are as follows:

MS (ES) m/z T- and P-fractions: Pos. mode: 405 (MH⁺); neg. mode: 403 (M-

H⁺).

EXAMPLE 240 N-(2-Chloro-4-cyanophenyl)-8-hydroxy-7-quinolinecarboxamide
(V-92) (Refer to Chart V):

Following GP V starting with 4-amino-3-chlorobenzonitrile (31 mg).

5 Physical characteristics are as follows:

MS (ES) m/z T-fraction: Neg. mode: 322 and 324 (M-H⁺).

EXAMPLE 241 N-(5-Bromopyridin-2-yl)-8-hydroxy-7-quinolinecarboxamide (V-93) (Refer to Chart V):

Following GP V starting with 2-amino-5-bromopyridine (35 mg).

10 Physical characteristics are as follows:

EXAMPLE 242 8-Hydroxy-N-(8-hydroxyquinolin-2-yl)-7-quinolinecarboxamide
(V-94) (Refer to Chart V):

15 Following GP V starting with 2-amino-8-hydroxyquinoline (33 mg).

Physical characteristics are as follows:

MS (ES) m/z T- and P-fractions: Pos. mode: 332 (MH⁺); neg. mode: 330 (M-H⁺).

20 PREPARATION 38 2-Amino-5-alkylamino-1,3,4-thiadiazoles (GP I) (Refer to Chart W.):

2-Amino-5-bromo-1,3,4-thiadiazole W-95 (1 eq.) is dissolved in DMF at r.t. The alkyl amine (about 1 eq.) and DIPEA (1-3 eq.) are added respectively and the solution stirred for 20 h. The solvent is removed under reduced pressure, the residue is diluted in AcOEt and washed with an aq. buffer sol. at pH 4 (2x). The
25 org. phase is dried over MgSO₄, filtered, and the solvent removed under reduced pressure. The residue is either crystallized from AcOEt/hexanes or purified by FC.

PREPARATION 39 N-Aryl-8-hydroxy-7-quinolinecarboxamides from anhydride U-1,
procedure for single compounds (GP II):

Anhydride U-1 (1 eq.) is dissolved in CHCl₃ (n mL) at r.t. Pyridinium chloride
30 (1 eq) and then the arylamine (about 1 eq.) are added. The solution is stirred for 6 h at r.t. 1M HCl/H₂O (n mL) is added and the biphasic mixture is stirred efficiently overnight. The precipitate is filtered, washed with a little water and CH₂Cl₂ and dried under high vacuum.

35 PREPARATION 40 N-Aryl-8-hydroxy-7-quinolinecarboxamides from anhydride U-1,
procedure for parallel synthesis (GP III):

The aryl amines (0.20 mmol) are laid into syringes corked at their output and

set with a frit at the bottom of their large section. A sol. of anhydride U-1 (0.1M) and of pyridinium chloride (0.1M) in CHCl_3 is prepared. This solution (2 mL/syringe) is added into the syringes; if the arylamine is a liquid, it is added at this stage only; if the arylamine is a hydrochloride salt, DIPEA (33 μL , 1 eq) is added. The syringes are tightly closed at their bottoms and shaken for 6 h at r.t. 1M $\text{HCl}/\text{H}_2\text{O}$ (2 mL) is added and the biphasic mixture is shaken efficiently overnight. The precipitate is isolated by sucking the solvent from the bottom of the syringes, is washed with a little water and CH_2Cl_2 and dried under high vacuum.

PREPARATION 41: N-Aryl-8-hydroxy-7-quinolinecarboxamides from the ester U-3, procedure for single compounds (GP IV):

Ester U-3 is dissolved in CH_2Cl_2 and the arylamine (about 1 eq) and DIPEA (about 1 eq.) are added. The reaction mixture is stirred between 6 h and 6 days. MeOH (same amount as CH_2Cl_2) is added and the mixture is stirred between 6 h and 18 h. For the work-up procedures, see specific examples below.

PREPARATION 42: N-Aryl-8-hydroxy-7-quinolinecarboxamides from ester U-3, procedure for parallel synthesis (GP V):

The aryl amines (0.2 mmol) are put into syringes corked at their output and set with a frit at the bottom of their large section. A sol. of ester U-3 (0.05M) and of DIPEA (0.05M) in CH_2Cl_2 is prepared and added to the arylamines (4 mL for each amine); if the arylamine is a liquid, it is added at this stage only; if the arylamine is a salt, DIPEA (33 μL , 1 eq) is added. The syringes are tightly closed and shaken for 5 days. MeOH (2-4 mL) is added and the mixture is shaken for 6 h. The precipitate, if any, is isolated by sucking the solvent from the bottom of the syringes, washed with AcOEt and dried under high vacuum (P-fraction). The filtrate is washed with sat. $\text{NaHCO}_3/\text{H}_2\text{O}$ (1x) and an aq. buffer sol. at pH4 (1x); each time, the aq. phase is pipetted out of the syringe. If a precipitate appeared during the work-up, it is filtered and dried (WU-fraction). The filtrate is blown down with a nitrogen stream, AcOEt (4 mL) is added and the mixture heated to 65°C for 30 min. and cooled to 0°C. The solvent is pipetted out and the residue dried under high vacuum (T-fraction). The org. phase is blown down and the residue dried under high vacuum as well (S-fraction). The degree of hydration of the obtained products was not determined.

PREPARATION 43 Hydrolysis of the tert-butyl esters to the carboxylic acids (GP VI):

tert-Butyl ester is dissolved in TFA at 0°C and the solution stirred for 4 h at

r.t. The solvent is removed under reduced pressure and the residue triturated in hot EtOH (95%). After cooling down to r.t. or 0°C, the precipitated is filtered, washed with AcOEt and dried under high vacuum.

PREPARATION 44 8-[(2,2,2-Trichloroethoxy)carbonyloxy]-7-quinolinecarboxylic acid anhydride with 2,2,2-trichloroethyl hydrogen carbonate (U-1):

In a flame-dried flask, 8-hydroxy-7-quinolinecarboxylic acid (2.00 g) is suspended into CH₂Cl₂ (100 mL) and DIPEA (3.70 mL) is added. The mixture is stirred until homogeneity is reached and cooled to 0°C. Trichloroethyl chloroformate (3.00 mL) is added and the solution is stirred for 3 h at 0°C, then stirred for another hour while allowed to warm up slowly to r.t. The solution is washed with 1M HCl/H₂O (1x), dried over Na₂CO₃ and the solvent removed under reduced pressure. Crystallization of the residue from CHCl₃/hexanes yields the desired product (5.20g).

Physical characteristics are as follows:

PREPARATION 46 7-(Fluorocarbonyl)-quinolin-8-yl acetate (U-3):

In a flame-dried flask under Ar, 8-acetoxy-7-quinolinecarboxylic acid U-2 (4.30 g) is suspended into CH₂Cl₂ (110mL). Pyridine (1.50 mL) is added and the suspension cooled to -40°C. Cyanuric fluoride (3.00 mL) is added and the mixture stirred for 3 h, while the temperature rose slowly to 0°C. Ice and water and CH₂Cl₂ (100mL) were added. Phases were shaken, separated and the aq. phase extracted

with CH_2Cl_2 (1x). The combined org. phases were dried over MgSO_4 , filtered, and the solvent is removed under reduced pressure. Crystallization of the residue from hexanes yields ester U-3 as white needles (4.10 g).

Physical characteristics are as follows:

PREPARATION 47 2-Amino-5-bromo-1,3,4-thiadiazole (W-95) (Refer to Chart W.):

To a stirred sol. of 2-amino-1,3,4-thiadiazole (40.5 g) in acetic acid (250 mL) is added bromine (22.7 ml) over about 20 minutes. The flask is surrounded by an ice
15 bath during the addition to maintain the reaction temperature near 25°C. Following the addition, the ice bath is removed and the clear red sol. stirred at r.t. for 18 hours, then added to 1L of cracked ice. Excess bromine is quenched with 10% $\text{NaHSO}_3/\text{H}_2\text{O}$ and 40 ml of 50% $\text{NaOH}/\text{H}_2\text{O}$ is added. The precipitated solid is isolated by filtration and washed well with water, then dissolved in 300 ml of water
20 containing 40 ml conc. HCl. The solution is filtered from a small amount of solid, then 87 g of K_2HPO_4 in a small quantity of water is added. The resulting slurry is chilled in ice and filtered, and the solid washed well with water. Recrystallization of the product from 400 ml of ethanol provides thiadiazole W-95 (26.3 g) as tan crystals.

25 Physical characteristics are as follows:

$^1\text{H-NMR}$ (d_6 -DMSO) δ 7.51.

PREPARATION 48 2-Amino-5-(2-phenylethyl)amino-1,3,4-thiadiazole (W-96) (Refer to Chart W.):

A mixture of 2-amino-5-bromo-1,3,4-thiadiazole W-95 (360 mg), of
30 phenethylamine (0.38 mL) and of K_2HPO_4 (522 mg) in DMF (2 mL) is heated under nitrogen at 100°C for 2 h, then partitioned between water and AcOEt. The organic phase is washed with water and brine, dried over MgSO_4 , and concentrated under reduced pressure. FC ($\text{MeOH}/\text{CH}_2\text{Cl}_2$ 5:95) provides thiadiazole W-96 (261 mg). Recrystallization of 238 mg of this from acetonitrile/toluene affords 205 mg of fine
35 white crystals.

PREPARATION 49 2-Amino-5-(butylamino)-1,3,4-thiadiazole (W-97) (Refer To Chart W.):

To a stirred, cooled (0°C) mixture of 2-amino-5-bromothiadiazo-
10 le W-95 (5.40 g) and of K₂HPO₄ (5.7 g) in DMF (20 mL) is added n-butylamine (5.9 ml). The ice bath is removed and the mixture stirred at room temperature for 18 h, then partitioned between water and AcOEt. Continuous extraction with CH₂Cl₂ is necessary to remove all product from the aqueous phase. The combined organic phase is dried over MgSO₄ and concentrated under reduced pressure. FC
15 (MeOH/CH₂Cl₂ 7:93) provides thiadiazole W-97 (3.49 g). Recrystallization from acetonitrile/toluene affords 3.34 g of white needles.

PREPARATION 51 Amino-1,3-benzodioxol-5-ylacetonitrile (W-99) (Refer to Chart W.):

35 Piperonal (6.00g) is dissolved in THF (25 mL) and aq. NH₃ (58%, 4.2 mL), NH₄Cl (3.3 g) and KCN (3.9 g) are added. The mixture is stirred efficiently for 24 h.

MgSO₄ is added and the mixture stirred for 30 min., filtered and washed with THF. The filtrate is evaporated under reduced pressure and the residue purified by FC (Et₂O/petrol ether 1:2, → 2:1, → Et₂O). Aminonitrile W-99 is obtained as a brown, unstable oil (2.87 g). The hydrochloride salt is precipitated from sat. HCl/Et₂O for analytical purposes.

EXAMPLE 253 N-[5-[(1,3-Benzodioxol-5-ylmethyl)amino]-1,3,4-thiadiazol-2-yl]-8-hydroxy-7-quinolinecarboxamide (Y-128) (Refer to Chart Y):

According to GP IV, starting from ester U-3 (85 mg), 2-amino-5-[N-(1,3-benzodioxol-5-ylmethyl)amino]-1,3,4-thiadiazole X-109 (90 mg), DIPEA (70 μ L) and CH_2Cl_2 (4 mL). Stirred for 20 h, then for 5 h with MeOH. After adding MeOH, a yellow precipitate appears, that is filtered and dried (40 mg); this precipitate proved to be the not quite pure amide Y-128 and was not further purified due to its low solubility.

Physical characteristics are as follows:

mp: 280-282°C.

$^1\text{H-NMR}$ (d_6 -DMSO, 300 MHz) δ 8.86, 8.53, 8.02, 7.85, 7.76, 7.22, 6.93, 6.85, 5.97, 4.34.

$^{13}\text{C-NMR}$ (d_6 -DMSO, 75 MHz), due to the low solubility of the product, an incomplete set of signals is obtained δ 147.72, 146.73, 133.15, 132.42, 123.95, 121.36, 121.23, 108.66, 108.54, 101.33.

EXAMPLE 254 (S)-N-[5-([(tert-Butoxy)carbonyl]-[4-hydroxybenzyl]methyl)-amino]-1,3,4-thiadiazol-2-yl]-8-hydroxy-7-quinolinecarboxamide (Y-129) (Refer to Chart Y):

According to GP IV, starting from ester U-3 (500 mg), N-(2-amino-1,3,4-thiadiazol-5-yl)tyrosine tert-butyl ester X-110 (720 mg), DIPEA (0.36 mL) and CH_2Cl_2 (10 mL). Stirred for 7 h, then overnight with MeOH. The solvent is almost completely removed until a consistent precipitate appeared that is filtered, washed with AcOEt and MeOH and dried under high vacuum. The product obtained as a yellow powder (0.53 g) was a not unpurified mixture of amide Y-129 (80 mol% by $^1\text{H-NMR}$) and acetylated product (20 mol%).

Physical characteristics are as follows:

$^1\text{H-NMR}$ (d_6 -DMSO, 300 MHz) δ 8.85, 8.54, 8.01, 7.90-7.70, 7.30-6.95, 4.60-4.30, 3.15-2.85, 1.31.

According to GP IV, starting from ester U-3 (500 mg)), N¹-(2-amino-1,3,4-thiadiazol-5-yl)-N⁵-[(benzoxy)carbonyl]lysine tert-butyl ester X-111 (0.93 g), DIPEA (0.36 mL) and CH₂Cl₂ (10 mL). Stirred for 7 h, then overnight with MeOH. The solvent is almost completely removed until a consistent precipitate appears. It is
5 filtered, washed with AcOEt and MeOH and dried. A yellow foam is obtained (0.50 g) that proved to contain about 90 mol% (¹H-NMR) of amide Y-130.

Physical characteristics are as follows:

wherein R⁷ is

- a) -H,
- b) -F,
- c) -Cl, or
- 5 d) -Br;

wherein R⁸ is

- a) -C₁-C₄ alkyl,
- b) -W¹-H, or
- c) -CH₂W¹H;

10 wherein R⁹ is

- a) -C₁-C₇ alkyl,
- b) -C₃-C₈ cycloalkyl,
- c) -C(O)R¹¹,
- d) -C(O)NHR¹¹,
- 15 e) -CH(OH)R¹¹,
- f) -CH₂OH,
- g) -CO₂R¹¹, or
- h) -aryl;

wherein R¹⁰ is

- 20 a) -H,
- b) -C₁-C₈ alkyl,
- c) -C₃-C₈ cycloalkyl,
- d) -(CH₂)_n-aryl optionally substituted with F, Cl, CH₂OH or -NO₂,
- e) -(CH₂)_n-het, or
- 25 f) -CH₂-C₃-C₃ cycloalkyl;

wherein R¹¹ is

- a) -C₁-C₇ alkyl,
- b) -C₃-C₈ cycloalkyl,
- c) -(CH₂)_n X¹, or
- 30 d) -CH₂-C₃-C₈ cycloalkyl;

wherein X¹ is

- a) -aryl substituted by zero (0), one (1), two (2), or three (3) R⁴,
- b) -het substituted by zero (0), one (1) or two (2) R⁵,
- c) -C₁-C₈ alkyl,
- 35 d) -CH(OH)-phenyl,
- e) -S-phenyl,

- f) -NHSO₂-phenyl substituted by one (1), two (2) or three (3) R⁴,
g) -CN,
h) -OH,
i) -C₃-C₈ cycloalkyl substituted by zero (0), one (1) or two (2) R⁸, or
5 j) -4-cyano-2,3,5,6-tetrafluoro-phenyl;

wherein X² is

- a) -aryl substituted by zero (0), one (1), two (2) or three (3) R⁴,
b) -het substituted by zero (0), one (1) or two (2) R⁵,
c) -C₁-C₈ alkyl,
10 d) -CH(OH)-phenyl, or
e) -C₃-C₈ cycloalkyl substituted by zero (0), one (1) or two (2) R⁸;

wherein W¹ is

- a) -NH,
b) -oxygen, or
15 c) -sulfur;

wherein V¹ is

- a) -R¹¹,
b) -C(O)R¹¹,
c) -SO₂R¹¹, or
20 d) -C(O)NHR¹¹;

wherein Z¹ is

- a) -C₁-C₇ alkyl,
b) -C₃-C₈ cycloalkyl,
c) -C(O)R¹¹,
25 d) -C(O)NHR¹¹, or
e) -CO₂R¹¹;

wherein -aryl is

- a) -phenyl,
b) -naphthyl,
30 c) -biphenyl,
d) -tetrahydro-naphthyl, or
e) fluorenyl;

wherein -het is a 5-, 6- or 7-membered saturated or unsaturated ring containing
from one (1) to three (3) heteroatoms selected from the group consisting of nitrogen,
35 oxygen and sulfur; and including any bicyclic group in which any of the above
heterocyclic rings is fused to a benzene ring or another heterocyclic;

wherein -cycloalkyl is a saturated or unsaturated hydrocarbon ring including any bicyclic group in which the above ring is connected to a benzene, heterocyclic or other hydrocarbon ring;

wherein n is zero (0) to six (6), inclusive;

5 wherein p is one (1), two (2) or three (3);

or a pharmaceutically acceptable salt or N-oxide thereof.

2. The compound of formula IA of claim 1 provided that:

a) when R^0 is $-(CH_2)_n-X^1$ and X^1 is -OH, then n is one or greater; and

10 b) when R^0 is $-(CH_2)_p-W^1X^2$, W^1 is -oxygen or -sulfur and X^2 is phenyl then R^4 is other than t-pentyl;

3. A compound of formula I of claim 1

20 wherein R^1 is

a) -H,

b) -F,

c) -Cl,

d) -Br,

25 e) $-CF_3$, or

f) $-NO_2$;

wherein R^2 is

a) -H,

b) $-C_1-C_3$ alkyl,

30 c) -OH,

d) $-CF_3$,

e) $-CH=CH$ -furanyl,

f) $-CH=CH$ -phenyl substituted by zero (0) or one (1) R^4 ,

g) $-CH=CH$ -pyridinyl, or

35 h) $-(CH_2)_p$ -phenyl substituted by zero (0) or one (1) R^4 ;

wherein R^3 is

- a) -H,
- b) -OH,
- c) -CF₃, or
- d) -C₁-C₃alkyl;

5 wherein X¹ is

- a) -phenyl substituted by zero (0) or one (1) R⁴,
- b) -het substituted by zero (0) or one (1) R⁵,
- c) -C₁-C₁₂ alkyl,
- d) -CH(OH)-phenyl,
- 10 e) -S-phenyl,
- f) -naphthyl,
- g) -NHSO₂-phenyl substituted by one (1) R⁴, or
- h) -CN;

wherein het is

- 15 a) -1,3,4-thiadiazol-2-yl,
- b) -4,5-dihydro-4-oxo-2-thiazolyl,
- c) -thiazolyl,
- d) -benzothiazolyl,
- e) -pyridinyl,
- 20 f) -morpholinyl, or
- g) -imidazolyl;

wherein R⁴ is

- a) -H
- b) -F,
- 25 c) -Cl,
- d) -Br,
- e) -NO₂,
- f) -OCH₃,
- g) -CF₃, or
- 30 h) -C₁-C₄ alkyl;

wherein R⁵ is

- a) -H,
- b) -F,
- c) -Cl,
- 35 d) -Br,
- e) -(CH₂)_n-(phenyl substituted by R⁶),

f) -thienyl substituted by R^7 , or

g) -OH;

wherein R^6 is

a) -H,

5 b) -F,

c) -Cl, or

d) -Br;

wherein R^7 is

a) -H,

10 b) -F,

c) -Cl, or

d) -Br;

wherein n is zero (0) to six (6) inclusive;

or a pharmaceutically acceptable salt or a N-oxide thereof.

c) $-C(O)R^{11}$,
15 d) $-C(O)NHR^{11}$, or
e) $-CO_2R^{11}$;

wherein $-aryl$ is

- a) $-phenyl$,
b) $-naphthyl$,
20 c) $-biphenyl$,
d) $-tetrahydro-naphthyl$, or
e) $fluorenyl$;

wherein $-het$ is a 5-, 6- or 7-membered saturated or unsaturated ring containing from one (1) to three (3) heteroatoms selected from the group consisting of nitrogen,
25 oxygen and sulfur; and including any bicyclic group in which any of the above heterocyclic rings is fused to a benzene ring or another heterocyclic;

wherein $-cycloalkyl$ is a saturated or unsaturated hydrocarbon ring including any bicyclic group in which the above ring is connected to a benzene, heterocyclic or other hydrocarbon ring;

30 wherein n is zero (0) to six (6), inclusive;

wherein p is one (1), two (2) or three (3);

or a pharmaceutically acceptable salt or N-oxide thereof.

7. The use of claim 6 wherein the compound is selected from the group
35 consisting of:

wherein R¹ is

- a) -H,
- b) -C₁-C₅ alkyl, or
- c) -CH=CH-aryl;

10 wherein R² is

- a) -C₁-C₁₀ alkyl,
- b) -(CH₂)_nR³,
- c) -CH(R⁴)R³, or
- d) -(CH₂)_n-X²-R³;

15 wherein R³ is

- a) -aryl,
- b) -het substituted by zero (0) to two (2) R⁵, or
- c) -C₃-C₆ cycloalkyl;

wherein R⁴ is

- 20 a) -C₁-C₅ alkyl, or
- b) -aryl;

wherein X¹ is

- a) -H,
- b) -F,
- 25 c) -Cl,
- d) -Br, or
- e) -I;

wherein X² is

- a) -O-,
- 30 b) -S-, or
- c) -NH-;

wherein n is zero (0) to four (4) inclusive;

wherein aryl is

- a) phenyl substituted by zero (0) to two (2) R⁵, or
- 35 b) naphthyl substituted by zero (0) to two (2) R⁵;

where in het is a 5-, 6- or 7-membered saturated or unsaturated ring containing from

one (1) to three (3) heteroatoms selected from the group consisting of nitrogen, oxygen and sulfur; and including any bicyclic group in which any of the above heterocyclic rings is fused to a benzene ring or another heterocycle; and the ring may be connected through a carbon or secondary nitrogen in the ring or an exocyclic nitrogen; and if chemically feasible, the nitrogen and sulfur atoms may be in the oxidized forms; and if chemically feasible, the nitrogen atom may be in the protected form;

wherein R^5 is

- a) -H,
- 10 b) -C₁-C₅ alkyl,
- c) -F,
- d) -Cl,
- e) -OCH₃,
- f) -CF₃,
- 15 g) -NHSO₂-het substituted by zero (0) to two (2) -C₁-C₅ alkyl, or
- h) -NHSO₂-phenyl;

or a pharmaceutically acceptable salt thereof.

10. The compound of claim 9 of formula III

20 wherein R^1 is

- a) -H,
- b) -CH₃, or
- c) -CH=CH-phenyl;

wherein R^2 is

- 25 a) -(CH₂)_nR³,

20 b) -Cl,
c) -Br,
d) -I,
e) -CF₃,
f) -C₁-C₄-alkyl, or
25 g) -C₁-C₂-alkylsubstituted with an aryl;

wherein R¹⁰ is

- a) hydrogen,
b) -C₁-C₄ alkyl,
c) phenyl,
30 d) benzyl, or
e) 4-nitrophenyl.

15. A compound of claim 14

wherein het is

- 35 a) indazolyl,
b) indoyl, or

- c) isoxazolyl substituted with one (1) or two (2) C₁-C₄ alkyl.

16. A compound of formula VI or VII

5

10 wherein X is

- a) -C, or
b) -SO;

wherein Y is

- a) -NH,
15 b) -O, or
c) -S;

wherein EWG is an electron withdrawing group;

wherein R¹, R² and R³ are as defined in claim 1;

wherein R⁴ is

- 20 a) -H,
b) -(CH₂)_n-CO₂-C₁-C₆ alkyl,
c) -(CH₂)_m-phenyl optionally substituted with one (1) or two (2) R⁷,

5 (S)-N-[5-((1-[(tert-Butoxy)carbonyl]-3-methylbutyl)amino)-1,3,4-thiadiazol-2-yl]-8-hydroxy-7-quinolinecarboxamide monohydrate;

(S)-N-(5-{2-[(tert-Butoxy)carbonyl]pyrrolidin-N-yl}-1,3,4-thiadiazol-2-yl)-8-hydroxy-7-quinolinecarboxamide semihydrate;

(S)-N-[5-((1-[(tert-Butoxy)carbonyl]-3-[methylmercapto]propyl)amino)-1,3,4-thiadiazol-2-yl]-8-hydroxy-7-quinolinecarboxamide monohydrate;

10 (S)-N-[5-((1-[(tert-Butoxy)carbonyl]-2-indol-3-ylethyl)amino)-1,3,4-thiadiazol-2-yl]-8-hydroxy-7-quinolinecarboxamide monohydrate;

(S)-N-(5-{1-[(tert-Butoxy)carbonyl]-2-[4-(tert-butoxy)phenyl]ethyl}amino)-1,3,4-thiadiazol-2-yl]-8-hydroxy-7-quinolinecarboxamide monohydrate;

15 (S)-N-[5-((1,2-Di-[(tert-butoxy)carbonyl]ethyl)amino)-1,3,4-thiadiazol-2-yl]-8-hydroxy-7-quinolinecarboxamide monohydrate;

N-(2-[(8-Hydroxyquinolin-7-yl)amido]-1,3,4-thiadiazol-5-yl)-2-benzo-1,3-dioxol-5-ylglycine monohydrotrifluoroacetate;

N-(2-[(8-Hydroxyquinolin-7-yl)amido]-1,3,4-thiadiazol-5-yl)-2-benzo-1,3-dioxol-4-ylglycine monohydrotrifluoroacetate; and

20 N-(2-[(8-Hydroxyquinolin-7-yl)amido]-1,3,4-thiadiazol-5-yl)tryptophan monohydrotrifluoroacetate.

19. The compound of claim 1 selected from the group consisting of:

25 N-[(4-Chlorophenyl)methyl]-8-hydroxy-4-methyl-2-(trifluoromethyl)-7-quinolinecarboxamide;

N-(4-Chlorophenyl)-8-hydroxy-2-methyl-7-quinolinecarboxamide;

N-[(4-Chlorophenyl)methyl]-8-hydroxy-5-nitro-7-quinolinecarboxamide;

30 N-[4,5-dihydro-[5-(3-nitrophenyl)]-4-oxo-2-thiazolyl]-8-hydroxy-7-quinolinecarboxamide;

N-[5-[3-(4-Chlorophenyl)methyl]-4,5-dihydro-4-oxo-2-thiazolyl]-8-hydroxy-7-quinolinecarboxamide;

8-Hydroxy-N-[2-(phenylthio)ethyl]-2-(trifluoromethyl)-7-quinolinecarboxamide;

N-[(4-Chlorophenyl)methyl]-4,8-dihydroxy-2-methyl-7-quinolinecarboxamide;

35 (E)-8-Hydroxy-2-(2-phenylethenyl)-N-(3-phenylpropyl)-7-quinolinecarboxamide;

- 8-Hydroxy-quinoline-7-carboxylic acid trans-4-hydroxy-cyclohexylamide;
[4-(3,4-Dichlorophenyl)-piperazin-yl]-(8-hydroxy-quinolin-7-yl)-methanone;
8-Hydroxy-quinoline-7-carboxylic acid bezo[1,3]dioxol-5-ylmethanamide;
N-Hexyl-8-hydroxy-7-quinolinecarboxamide;
- 5 8-Hydroxy-quinoline-7-carboxylic acid 2-(5-nitro-pyridin-2-ylamino)-
ethylamide;
8-Hydroxy-N-[2-(phenyloxy)ethyl]-7-quinolinecarboxamide;
8-Hydroxy-quinoline-7-carboxylic acid 2-(R)-hydroxy-1-(S)-methyl-2-phenyl-
ethylamide;
- 10 (S)-2-[(8-Hydroxy-quinoline-7-carbonyl)-amino]-3-phenyl-propionic acid ethyl
ester;
8-Hydroxy-quinoline-7-carboxylic acid cyano-phenylamide;
(S)-2-[(8-Hydroxy-quinoline-7-carbonyl)-amino]-4-methyl-pentan-2-ic acid tert-
butyl ester;
- 15 (S,S)-8-Hydroxy-quinoline-7-carboxylic acid 2-hydroxy-1-(hydroxy-phenyl-
methyl)-ethylamide;
(S,S)-8-Hydroxy-quinoline-7-carboxylic acid 1-hydroxymethyl-2-methyl-
butylamide;
(S)-8-Hydroxy-quinoline-7-carboxylic acid 1-benzyl-2-hydroxy-ethylamide;
- 20 8-Hydroxy-quinoline-7-carboxylic acid thiophen-2-ylmethanamide;
(R)-8-Hydroxy-quinoline-7-carboxylic acid 2-hydroxy-1-phenyl-ethylamide;
N-[2-(2-chlorophenyl)ethyl]-8-hydroxy-7-quinolinecarboxamide;
N-[(3,4-Difluorophenyl)methyl]-8-hydroxy-7-quinolinecarboxamide;
N-[(2-Chloro-6-fluoro-phenyl)methyl]-8-hydroxy-7-quinolinecarboxamide;
- 25 N-[(2-Chloro-4-fluoro-phenyl)methyl]-8-hydroxy-7-quinolinecarboxamide;
N-[(3,5-Dichloro-phenyl)methyl]-8-hydroxy-7-quinolinecarboxamide;
(S)-8-Hydroxy-quinoline-7-carboxylic acid 2-hydroxy-1-phenyl-ethylamide;
N-[2-(2-fluorophenyl)ethyl]-8-hydroxy-7-quinolinecarboxamide;
N-[2-(4-fluorophenyl)ethyl]-8-hydroxy-7-quinolinecarboxamide;
- 30 trans-8-Hydroxy-quinoline-7-carboxylic acid 4-[(8-hydroxy-quinoline-7-
carbonyl)-amino]-cyclohexyl ester;

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 6 C07D A61K C07F

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

| Category | Citation of document, with indication, where appropriate, of the relevant passages | Relevant to claim No. |

Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier document but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

"&" document member of the same patent family
